# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 420 reports, journal articles and other documents originally announced in February 1990 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

Information on the availability of cited publications including addresses of organizations and NTIS price schedules is located at the back of this bibliography.

# TABLE OF CONTENTS

	<b>Page</b>
<b>Category 01     Aeronautics (General)</b>	<b>81</b>
<b>Category 02     Aerodynamics</b> Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.	<b>82</b>
<b>Category 03     Air Transportation and Safety</b> Includes passenger and cargo air transport operations; and aircraft accidents.	<b>95</b>
<b>Category 04     Aircraft Communications and Navigation</b> Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.	<b>96</b>
<b>Category 05     Aircraft Design, Testing and Performance</b> Includes aircraft simulation technology.	<b>100</b>
<b>Category 06     Aircraft Instrumentation</b> Includes cockpit and cabin display devices; and flight instruments.	<b>108</b>
<b>Category 07     Aircraft Propulsion and Power</b> Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and onboard auxiliary power plants for aircraft.	<b>109</b>
<b>Category 08     Aircraft Stability and Control</b> Includes aircraft handling qualities; piloting; flight controls; and autopilots.	<b>117</b>
<b>Category 09     Research and Support Facilities (Air)</b> Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tubes; and aircraft engine test stands.	<b>121</b>
<b>Category 10     Astronautics</b> Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; space communications, spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.	<b>123</b>
<b>Category 11     Chemistry and Materials</b> Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; propellants and fuels; and materials processing.	<b>124</b>

<b>Category 12    Engineering</b>	<b>127</b>
Includes engineering (general); communications and radar; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.	
<b>Category 13    Geosciences</b>	<b>137</b>
Includes geosciences (general); earth resources and remote sensing; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

COSATI CODE → CSCL 01/1 ← PRICE CODE

An experimental investigation is reported on slanted base ogive cylinders at zero incidence. The Mach number range is 0.05 to 0.3. All flow disturbances associated with wind tunnel supports are eliminated in this investigation by magnetically suspending the wind tunnel models. The sudden and drastic changes in the lift, pitching moment, and drag for a slight change in base slant angle are reported. Flow visualization with liquid crystals and oil is used to observe base flow patterns, which are responsible for the sudden changes in aerodynamic characteristics. Hysteretic effects in base flow pattern changes are present in this investigation and are reported. The effect of a wire support attachment on the 0 deg slanted base model is studied. Computational drag and transition location results using VSAERO and SANDRAG are presented and compared with experimental results. Base pressure measurements over the slanted bases are made with an onboard pressure transducer using remote data telemetry. Author

Flight tests were conducted at three different altitudes to detect transition on a smoothed test region of a swept-wing business jet wing using surface hot-film sensors and sublimating chemicals. Strong influence of sweep angle on transition location was observed when the aircraft was flown at some sideslip conditions to simulate changes in effective wing sweep angle. No effects of engine noise on transition were measured when different engine power settings were used. Flight instrumentation and ground data analysis techniques are described. Correlation was obtained between the hot-film sensor signals and sublimating chemicals for transition detection. Crossflow vortices were observed for one flight condition. Results of analyzed data for various flight-test conditions are presented. Author

## AERONAUTICS (GENERAL)

**A90-13557\*#** National Aeronautics and Space Administration, Washington, DC.

### RECENT RESULTS AND MAJOR ACTIVITIES IN THE NASA BALLOON PROGRAM

W. VERNON JONES (NASA, Space Physics Div., Washington, DC) IAF, International Astronautical Congress, 40th, Malaga, Spain, Oct. 7-13, 1989. 10 p. refs  
(IAF PAPER 89-468) Copyright

The Balloon-Borne Particle Astrophysics Magnet Facility and the Max '91 Solar Balloon Program exemplify NASA's state-of-the-art uses of instrumented balloons in scientific research. The latter program will involve the carriage of sophisticated solar study instrumentation over the mid-latitudes and Antarctica; four test flights of this balloon from Australia to South America are contributing to the development of a long-duration flight-support system with global tracking, command, and telemetry at both mid and high latitudes. O.C.

### INSTALLATION AND IMPLEMENTATION OF AN EXTRUSION CELL IN AIRCRAFT INDUSTRY UTILIZING GROUP TECHNOLOGY

JON PAUL TURVEY (Cessna Aircraft Co., Wichita, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 8 p.  
(SAE PAPER 891025) Copyright

The results of installing a cell designed to fabricate extrusion parts for aircraft industry complete except for chemical processing and paint are described. The installation sequence is shown and the consequent higher productivity, at all levels of the manufacturing organization is demonstrated. Comparisons are made with conventional part manufacturing processes. Strengths and weaknesses of the cell are examined with regard to electronic routing, operator's responsibilities, and management and union response. C.D.

### DESIGN FOR MAINTAINABILITY

GORDON T. VAIL (Townsend Co., Carrollton, TX) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 6 p.  
(SAE PAPER 891079) Copyright

Maintenance costs for the support of operational aircraft programs make up a large portion of the overall costs. This paper describes some basic processes that can be applied during design phases of the engine development program that can reduce such costs. The methods presented herein have been successfully used in the past and have been proven to be effective in reducing costs. Author

### THERMOPLASTIC COMPOSITE FIGHTER FORWARD FUSELAGE

ROBERT B. OSTROM, STEPHEN B. KOCH, and DEBRA L. WIRZ-SAFRANEK (Lockheed Composite Development Center, Burbank, CA) SAMPE Quarterly (ISSN 0036-0821), vol. 21, Oct. 1989, p. 39-45.

Copyright

A total of five intermediate service temperature thermoplastic matrix resins have been used in a technology validation program which used thermoplastic composites to construct a forward fuselage section structure representative of advanced fighter designs. Several different tooling systems were used to define the tool surfaces used for molding the various structural components from prepreps. An account is given of the lessons learned in the course of tooling, forming, consolidating, and joining the various composite structure elements; competing techniques and technologies have been evaluated to a high degree of certainty for future cost-competitive airframe primary structure manufacture. O.C.

### THE SOVIETS' FRENCH REVELATION. II - AIRCRAFT

RICHARD DEMEIS Aerospace America (ISSN 0740-722X), vol. 27, Nov. 1989, p. 42-46.

Copyright

The exhibition of the Su-27 interceptor at the Paris Air Show is described. The Su-27 interceptor, NATO code-named Flanker, was exhibited in both single- and two-seat variants, conservatively equipped with Lyulka AL31F turbofans and a fly-by-wire (FBW) flight control system that can minimize trim drag. Like the MiG-29, the Flanker is designed to operate from dispersed bases such as short, poor, and repaired fields, to keep an offensive going, and spread and hide forces. The MiG-29s in Paris were specifically made for display and marketing in the West. Other aircraft such as the Su-25, the Su-28, and the An-225 Mecha made their Western debut in Paris, including the Mi-28 combat helicopter. Commercial aircraft rounded out the Soviets' Paris push. Displayed were the Tu-204, a twin in the 757 class, and the four-engine Il-96, similar in size to the Airbus A-300. C.E.

### REVIEW AND ANALYSIS OF THE DNW/MODEL 360 ROTOR ACOUSTIC DATA BASE

R. A. ZINNER, D. A. BOXWELL, and R. H. SPENCER (Boeing Helicopter Co., Philadelphia, PA.) Nov. 1989 26 p Presented at the 15th European Rotorcraft Forum, Amsterdam, Netherlands, 12-15 Sep. 1989

## 01 AERONAUTICS (GENERAL)

(NASA-TM-102253; A-89213; NAS 1.15:102253;  
USAAVSCOM-TM-89-A-002) Avail: NTIS HC A03/MF A01  
CSCL 01B

A comprehensive model rotor aeroacoustic data base was collected in a large anechoic wind tunnel in 1986. Twenty-six microphones were positioned around the azimuth to collect acoustic data for approximately 150 different test conditions. A dynamically scaled, blade-pressure-instrumented model of the forward rotor of the BH360 helicopter simultaneously provided blade pressures for correlation with the acoustic data. High-speed impulsive noise, blade-vortex interaction noise, low-frequency noise, and broadband noise were all captured in this extensive data base. Trends are presented for each noise source, with important parametric variations. The purpose of this paper is to introduce this data base and illustrate its potential for predictive code validation.

### **N90-12495#** Naval Postgraduate School, Monterey, CA. **ESTIMATING THE RELATIONSHIPS BETWEEN THE STATE OF THE ART OF TECHNOLOGY AND PRODUCTION COST FOR THE US AIRCRAFT M.S. Thesis**

ROBERT E. LOWE Jun. 1989 80 p  
(AD-A212127) Avail: NTIS HC A05/MF A01 CSCL 01/3

The primary objective is to determine relationships that exist between production cost and the state of the art of technology and extensions in technology for high-technology systems. The data sample selected for study was U.S. military tactical aircraft. The central methodology used in the analysis of the aircraft data base includes: the development of measures for the state of the art of technology and the level of technology advance that exists within U.S. fighter and attack aircraft programs; the development of measures for each aircraft program's production cost; and the application of various statistical procedures (regression analysis) to test specific hypotheses and build models to explain the relationships between technology and cost. General conclusion from this study are that significant relationships do in fact exist between aircraft production cost and specific technology measures.

Recent policy studies have failed to provide adequate guidance for planning and evaluating the nation's program of aeronautical research and development. In particular, the government's use of experimental systems to bridge the gap between laboratory research and operational systems remains controversial. This thesis used retrospective examinations of NASA's work in aircraft noise reduction, powered-lift technology, and hypersonic flight technology to analyze the impact and effectiveness of such programs under four general circumstances that may justify government involvement in a market-driven economy. It concludes that the NASA proof-of-concept program has had mixed results, with technical goals more successfully accomplished than policy goals. The public benefits of the successes, however, far outweigh the costs of the disappointments. The thesis concludes that such demonstration programs in aeronautical research and development should continue, with a series of analytical and institutional changes to couple them more closely with policy goals.

#### **AERODYNAMIC HEATING IN SHOCK WAVE/TURBULENT BOUNDARY LAYER INTERACTION REGIONS INDUCED BY BLUNT FIN**

SHIGERU ASO (Kyushu University, Fukuoka, Japan), ANZHONG TAN (Chinese Academy of Sciences, Institute of Mechanics, Beijing, People's Republic of China), and MASANORI HAYASHI (Nishinippon Institute of Technology, Fukuoka, Japan) Kyushu University, Faculty of Engineering, Memoirs (ISSN 0023-6160), vol. 49, June 1989, p. 109-124. refs

A study is conducted on aerodynamic heating in the interaction regions of shock waves and turbulent boundary layers induced by blunt fins with semicylindrical leading edges. The study is performed under the conditions of Mach number 4, 1.2 MPa total pressure, a 0.66 wall temperature to total temperature ratio, and Reynolds number of  $1.3 \times 10^6$  to  $7 \times 10^6$ . Blunt fins with leading-edge diameters of 6 mm and 10 mm are used to examine the influence of leading-edge diameter on the pressure and heat transfer rate distributions. The flow fields are visualized by the Schlieren method and the oil flow technique. The results show that two significant peaks are observed in the surface pressure and heat transfer rate distributions. The peaks are located along the reattachment line. It is also shown that the major scale factor governing the entire flow field is the leading-edge diameter of the blunt fin.

#### **THE EFFECT OF FLOW CURVATURE ON THE AERODYNAMIC CHARACTERISTICS OF AN OGIVE-CYLINDER BODY**

D. I. T. P. LLEWELYN-DAVIES (Cranfield Institute of Technology, England) Aeronautical Journal (ISSN 0001-9240), vol. 93, Oct. 1989, p. 301-310. refs  
Copyright

Low speed wind tunnel and whirling arm facility tests have been used to compile the pressure distributions over a 6:1 fineness ratio ogive cylinder model; these pressure distributions were integrated to obtain the local normal force loading distribution along the body and the overall normal-force and pitching moment involved in the center of normal-force. The primary difference among aerodynamic characteristics between the two test methods was a significant positive increase in normal-force loading over the entire afterbody in curvilinear motion, which varied little with the magnitude or sign of the pitch angle.

### **A90-13786**

#### **UNIFIED SUPER/HYPERSONIC SIMILITUDE FOR STEADY AND OSCILLATING CONES AND OGIVES**

KUNAL GHOSH (Indian Institute of Technology, Kanpur, India) Aeronautical Journal (ISSN 0001-9240), vol. 93, Oct. 1989, p. 311-322. Research supported by the Ministry of Defence Procurement Executive. refs  
Copyright

A unified similitude for super/hypersonic flow has been given for non-slender cones and quasicones with attached shock. The similitude space has been shown to be orthogonal to the bow

shock and an accurate scaling law for cone flows of different Mach numbers has been provided. A constant density solution has been obtained which gives simple formulas for shock angle and pressure on a cone. This leads to an axisymmetric shock expansion theory which incorporates the effect of profile curvature of an ogive in inviscid flow or a cone in viscous flow whose boundary layer displacement thickness is known a priori. The hypersonic formulas for pitching moment derivatives of oscillating cones and ogives have been adjusted to extend them to supersonic Mach numbers. Author

**EXPERIMENTAL INVESTIGATIONS OF EFFECTS OF THE STAGGER ANGLE ON SECONDARY FLOWS IN PLANE COMPRESSOR CASCADES [EXPERIMENTELLE UNTERSUCHUNGEN ZUM EINFLUSS DES STAFFELUNGSWINKELS AUF DIE SEKUNDAERSTROEMUNGEN IN EBENEN VERDICHTERGITTERN]**

UDO STARK (Braunschweig, Technische Universitaet, Brunswick, Federal Republic of Germany) Forschung im Ingenieurwesen (ISSN 0015-7899), vol. 55, Sept. 1989, p. 135-148. In German. refs

Copyright

Results of experiments carried out with two plane compressor cascades of different stagger angle (30 and 50 deg) are discussed. The objective was to learn more about the effects of the stagger angle on side wall boundary layers and secondary flows in compressor cascades. The three-way experiment included wake measurements in the center plane of the cascade for all inlet angles; wake measurements along the half span of a blade for one inlet angle each; and oil flow pictures of the tunnel side wall and both sides of a blade for all inlet angles. Different results were obtained for both cascades. Only those of the weakly staggered cascades indicated equivalence in size and development along span. By contrast, the highly staggered cascade had unexpected results. The behavior of the boundary layers on the tunnel side walls is the key for understanding the results. These boundary layers are found to be always separated with differently located separation lines and with different consequences. C.E.

Detection of the onset of recirculations at a centrifugal pump impeller inlet has been measured using air as the flowing fluid. The measured data have been analyzed in the time and frequency domain by means of hot-wire anemometry. The influence of different upstream velocity distributions on the onset of recirculations at the inlet is discussed. C.E.

**A90-14091\* High Technology Corp., Hampton, VA. GOERTLER VORTICES IN SUPERSONIC AND HYPERSONIC BOUNDARY LAYERS**

R. E. SPALL and M. R. MALIK (High Technology Corp., Hampton, VA) Physics of Fluids A (ISSN 0899-8213), vol. 1, Nov. 1989, p. 1822-1835. refs

(Contract NAS1-18240)

Copyright

The problem of Goertler vortices in compressible boundary layers over concave walls is considered. At  $O(1)$  wavelengths, the instability is governed by parabolic partial differential equations that are solved numerically to determine the effect of various initial conditions on the development of Goertler vortex instability in compressible boundary layers. The results show that both the

velocity and temperature fluctuations may lead to a Goertler vortex. The vortex growth rates determined from the present method are found to differ somewhat from those given by a normal mode solution. At both the supersonic and hypersonic Mach numbers, cooling has a small destabilizing effect. In addition, the most unstable disturbances shift toward lower wavelengths because of thinning of the boundary layer. The results also show that compressibility has a stabilizing effect on the Goertler instability, while the effect of an adverse pressure gradient is found to be destabilizing. The behavior of the Goertler vortex structure with Mach number is also examined. At hypersonic Mach numbers, vortices are located near the edge of the boundary layer for adiabatic wall conditions. However, the entire boundary layer is affected when the wall is cooled. Author

**A90-14331**

**SPANWISE DISTRIBUTION OF LIFT AND DRAG AT HIGH ANGLES OF ATTACK**

MELVIN H. SNYDER, WANG YONG, and GEORGE B. ROSS (Wichita State University, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 8 p. (SAE PAPER 891019) Copyright

Experimental results are presented which indicate that, at angles of attack above stall, spanwise lift and drag distributions of finite wings differ considerably from classic aerodynamic theory. The increase of lift force toward the wingtip is partially ascribable to 'side-edge' vortex lift; the use of leading-edge extension cuffs will further change the spanwise lift distribution above the wing's stall angle. On the basis of these results, a new wing incorporating a system of lateral controls is being tested to determine whether an extension of effective control at angles of attack beyond stall can be achieved. O.C.

**A90-14332**

**AN ITERATIVE NON-LINEAR LIFTING LINE MODEL FOR WINGS WITH UNSYMMETRICAL STALL**

BARNES W. MCCORMICK (Pennsylvania State University, University Park) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 11 p. refs (SAE PAPER 891020) Copyright

A numerical nonlinear lifting line model is presented which predicts the behavior of a wing beyond the stall given two-dimensional airfoil data. The model, although relatively simple, appears to predict fairly complex stall effects including hysteresis and unsymmetrical spanwise lift distributions with partial-span stall. The numerical model runs rapidly on an IBM-Compatible PC and does not require any extensive CFD-type of calculations. Because of its speed and apparent accuracy in modeling the physical behavior of a stalled wing, it may find application to the simulation of airplane motion beyond the stall. Although the numerical model was developed independently, here a similar approach has been tried previously by others. These previous efforts and a comparison with the present results are discussed briefly. Author

**A90-14333**

**DEVELOPMENT OF A STALL IMPROVEMENT PACKAGE FOR THE GULFSTREAM IV**

HUGH S. BRUNER (Gulfstream Aerospace Corp., Savannah, GA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 11 p. (SAE PAPER 891021) Copyright

A package of aerodynamic devices has been developed in order to enhance the stall characteristics of the Gulfstream IV. The package consists of an array of small vortilons beneath the leading edge plus a small stall strip inboard which control the spreading of airflow separation at stall. This package permits the aircraft to tailor the prestall and poststall characteristics without compromising the wing's excellent transonic cruise characteristics. The mechanisms by which the package works are explained and the flight test program is briefly reviewed. The results show improvement in the Gulfstream's stall characteristics. C.D.

An efficient implicit marching procedure is developed for solving stationary equations of gas motion. The method is unconditionally stable and avoids the need for block or scalar matrix inversion. Although flow of a nonviscous gas only is examined here for the sake of simplicity, the method can be easily extended to viscous flows. Details of the numerical solution and some calculation results are included. V.L.

Experimental data are presented on the effect of the relative inlet diameter and neck edge radius on the flow coefficient of straight-generatrix nozzles in the Reynolds number range  $2 \times 10$  to the 5th -  $9 \times 10$  to the 6th. Based on these data, the geometrical characteristics and applications of nozzles are determined. A relative inlet diameter of  $2 +$  or  $- 0.5$  and a neck edge radius of 0.005 or less are recommended for critical flowmeter nozzles; the flow coefficient of such nozzles will be 0.95, with a relative error of  $+$  or  $- 0.5$  percent in the Reynolds number range investigated. The mechanism by which the surface roughness of deposits in compressor cascades affects the flow lag angle is examined with reference to the results of wind tunnel tests on plane compressor cascades with variable artificially created deposits. The flow rate and blading parameters were selected as close as possible to those of real compressors. It is found that, for a fixed angle of attack, the flow lag angle increases with the deposit roughness. The lag angle also increases with the increasing density of the cascade. V.L.

**WING BOUNDARY LAYER CALCULATION AND ITS APPLICATION TO AIRCRAFT DESIGN**

HANLING BAO (Beijing Polytechnic University, People's Republic of China) Chinese Journal of Aeronautics (ISSN 1000-9361), vol. 2, Aug. 1989, p. 145-154. refs

Copyright

A new method for calculating three-dimensional compressible laminar and turbulent boundary layers on practical wings is described. A nonorthogonal coordinate system proposed by Cebeci (1979) is used, and a secondary coordinate transformation is suggested to overcome the difficulties which arise when negative transverse velocities appear locally. Several computed results for a C-5A aircraft wing and an F-8 supercritical wing are given, and comparisons with other methods and with experimental data are made. Author

**A90-15227#****RECENT NAVIER-STOKES CALCULATIONS IN APPLICATIONS**

H. YOSHIHARA (Office of Naval Research, Tokyo, Japan) (National Conference on Aerodynamics, 4th, Madras, India, Dec. 1988) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, Nov.-Dec. 1988, p. 221-227.

The capabilities and limitations of current Navier-Stokes codes for fluid-dynamics simulations are reviewed on the basis of sample computations. Results for (1) transonic flow with shock-induced separation on a swept wing, (2) high-lift supersonic flow over a delta wing, and (3) and hypersonic flow on the wing/fuselage of an aerospace plane in cruise are presented in graphs and diagrams and discussed in detail. The need for better modeling techniques to treat incipient and developed turbulence, hypersonic turbulence, and highly swept shocks is stressed. T.K.

In the present paper methods for the analysis of separated flow from bodies have been developed. An attempt has been made to describe the flow pattern past wings of different aspect ratio at high angles of attack. The separation from the fuselage like body is a little difficult to predict and some salient features have been discussed while developing the prediction method. The results have been compared with the available theoretical and experimental values. Author

**A90-15233#****COMPUTATION OF TRANSONIC SEPARATED FLOW USING THE EULER EQUATIONS**

S. SAHA (Indian Institute of Technology, Kharagpur, India) (National Conference on Aerodynamics, 4th, Madras, India, Dec. 1988) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, Nov.-Dec. 1988, p. 271-275.

Leading edge separated flow about a slender delta wing at 15 deg incidence and a match number of 0.9 has been computed by solving the Euler equations. The computed pressure distribution and total pressure loss contours show the presence of the separated vortex. The lift and drag coefficients obtained agree fairly well with experimental values. Author

N. S. MADHAVAN and V. SWAMINATHAN (ISRO, Vikram Sarabhai Space Centre, Trivandrum, India) (National Conference on Aerodynamics, 4th, Madras, India, Dec. 1988) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, Nov.-Dec. 1988, p. 281-285.

The validity of the thin layer Navier-Stokes equations, in which the viscous derivatives are retained only in the direction normal to the wall has been tested and confirmed in several flow field computations particularly in the context of high Reynolds number flows. In the present paper, the thin layer Navier-Stokes equations together with an algebraic turbulence model are solved using MacCormack's predictor-corrector time-marching numerical scheme for axisymmetric flow past cylinder-flare and cone-cylinder

geometries at various angles of attack at near flight Reynolds numbers. The results obtained for surface pressure distribution and skin friction coefficient from different flow field computations using the software developed and made operational on the CDC CYBER 170/730 computer of VSSC for the purpose were compared with experimental and earlier computed values. Author

**A90-15237#****TRANSONIC FLOW OVER A SINGLE WEDGE**

S. SANTHAKUMAR (Indian Institute of Technology, Madras, India) (National Conference on Aerodynamics, 4th, Madras, India, Dec. 1988) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, Nov.-Dec. 1988, p. 293-296. refs

The pressure distribution on a single wedge kept in transonic flow has been obtained by various authors on solving TSP equation exactly. In this paper, an approximate method has been used to calculate this pressure distribution. The method is based on a linearized equation which nevertheless simulates the TSP equation in the neighborhood of the airfoil. The result shows good agreement with exact results for the lower part of the transonic region. Author

**A90-15238#****WAKE-BOUNDARY LAYER INTERACTION**

V. RAMJEE, E. G. TULAPURKARA, and R. RAJASEKAR (Indian Institute of Technology, Madras, India) (National Conference on Aerodynamics, 4th, Madras, India, Dec. 1988) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, Nov.-Dec. 1988, p. 297-300. refs

The interactions between a turbulent boundary layer on a flat wall and the wake of a streamlined body as well as that of a bluff body of the same drag force are studied. The height of the lower edge of the wake from the wall is the same in the both cases. Mean velocity and longitudinal velocity fluctuations are presented at different downstream locations. Computations are carried out using a k-epsilon model of turbulence. The development of the boundary layer, the wake of airfoil, and its mixing with the boundary layer are numerically well-predicted. B. H. LAKSHMANA GOWDA (Indian Institute of Technology, Madras) and G. PADMANABHAM (Madras Institute of Technology, India) (National Conference on Aerodynamics, 4th, Madras, India, Dec. 1988) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, Nov.-Dec. 1988, p. 309-315. refs

The characteristic decay (CD) regions of three-dimensional turbulent wall jets generated from orifices having shapes of various segments of a circle are described in this paper. The influence of geometry on the decay rate of the maximum velocity and the length of the CD region is brought out. The results are compared with those for rectangular geometries and the differences in the mechanism of the formation of the CD region for the two types are discussed. The maximum velocities decay at a much faster rate for the present class of geometries compared to those for rectangular shapes. Author

**EULER SOLUTIONS WITH A MULTI-BLOCK STRUCTURED CODE**

ANAND KUMAR (National Aeronautical Laboratory, Bangalore, India) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, May 1988, p. 89-95. refs

Multiblock schemes enhance the scope of application of computational fluid dynamics to present-day complex configurations. With multiblock grid generation, embedded grids, and different equations in different domains, it should be possible to resolve the main features of flow over a complete aircraft with a grid containing about a million cells. Basic steps in the coding of multiblock schemes are described. Euler solutions for the vortex-dominated flow over a cropped delta wing are presented. These solutions show separation from the leading edge and formation of a leeside vortex. B.J.

**FULL-POTENTIAL CALCULATIONS USING CARTESIAN GRIDS**

S. S. DESAI, R. RANGARAJAN, J. P. SINGH, and K. S. RAVICHANDRAN (National Aeronautical Laboratory, Bangalore, India) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, May 1988, p. 97-103. refs

The full-potential equation in non-conservative form is solved in stretched Cartesian grid to obtain transonic solutions for flows past airfoils, axisymmetric bodies, wings and wing-body combinations. The main feature of the method is the use of suitable stretching functions to map the infinite physical domain into a finite computational domain. Computed results are promising and have underscored the simplicity of the Cartesian grid approach while assuring reasonable accuracy. Author

**DEVELOPMENT OF BLUFF BODY WAKE IN A LONGITUDINALLY CURVED STREAM**

V. RAMJEE, E. G. TULAPURKARA, and R. RAJASEKAR (Indian Institute of Technology, Madras, India) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, May 1988, p. 139-144. refs

Measurements of mean velocity and longitudinal turbulent fluctuations in the wake of a square cylinder are carried out in a straight duct and in a curved duct. The velocity profiles of the wake in the curved duct are asymmetric. The thickness of the shear layer is higher on the inner side than on the outer side. The inner side is the portion of the flow between the center line of the curved duct and the wall nearer to the center of the curvature.

The intensity of the longitudinal turbulence fluctuations is enhanced on the inner side of the flow and not appreciably affected on the outer side. Author

**CONVERGENCE PROPERTIES OF HIGH-REYNOLDS-NUMBER SEPARATED FLOW CALCULATIONS**

S. G. RUBIN and A. HIMANSU (Cincinnati, University, OH) International Journal for Numerical Methods in Fluids (ISSN 0271-2091), vol. 9, Nov. 1989, p. 1395-1411. refs  
Copyright

The accelerated pressure-relaxation scheme developed by Rubin and Reddy (1983) for the reduced Navier-Stokes equations is applied to the flow over a smooth bump and trough; fine meshes are employed to investigate the reasons for computational divergence observed previously. The governing equations and boundary conditions are given; the numerical discretization and the relaxation scheme are explained; and the results are presented in a series of graphs and characterized in detail. The apparent 'laminar flow breakdown' is found to be controllable by moderate wall suction and is tentatively attributed to a physical (rather than merely numerical) instability related to HF fine-grid modes which are not resolvable via the present modeling technique. T.K.

**NUMERICAL SIMULATION OF AN IMPINGING JET ON A FLAT PLATE**

SHU-HAO CHUANG (National Chunghsing University, Taichung, Republic of China) International Journal for Numerical Methods in Fluids (ISSN 0271-2091), vol. 9, Nov. 1989, p. 1413-1426. refs

Copyright

Two-dimensional normal impinging jet flowfields, with or without an upper plate, were analyzed by employing an implicit bidiagonal numerical method. The Jones-Launder K-epsilon two-equation turbulent model was employed to study the turbulent effects of the impinging jet flowfield. The upper plate surface pressure, the ground plane pressure and other physical parameters of the momentum flowfield were calculated at various jet exit height and jet inlet Reynolds numbers. These results were compared with those of Beam and Warming's numerical method, Hsiao and Chuang, and others, along with experimental data. The potential core length of the impinging jet without an upper plate is longer than that of the free jet because of the effects of the ground plane, while the potential core length of the impinging jet with an upper plate is shorter than that of the free jet because of the effects of the upper plate. This phenomenon in the present analysis provides a fundamental numerical study of an impinging jet and a basis for further analysis of impinging jet flowfields on a variable angle plate. Author

Unsteady effects involved in two kinds of aerodynamic interaction are investigated by means of two-dimensional and three-dimensional flow configurations. Both consist of a receiving airfoil R placed downstream of an emitting airfoil E. One of the airfoils is in fore-and-aft oscillatory motion. In each two-dimensional or three-dimensional flow configuration, the typical interaction features are studied on both the impinging vortical flow influenced by R and on the aerodynamic response of R submitted to the vortical flow. The R behavior is deduced from measurements performed on the overall aerodynamic coefficients and on local pressure and skin friction distributions. A comparative study is conducted on steady and unsteady mean quantities over the period, and also on the corresponding steady values obtained with E and

R at rest. The significance of the two-dimensional and three-dimensional unsteady effects associated with each flow configuration is thus pointed out and discussed, as a function of the geometric incidence of R both at low and high values.

A series of experiments are described which investigate and quantify the effect of loading on the three-dimensional flow through a subsonic annular cascade of cambered airfoils. At two levels of loading, detailed data quantify the cascade inlet velocity, the intrapassage flow field, the airfoil surface pressure distributions, the exit flow field, and the total pressure loss distributions. Aerodynamic loading is shown to strengthen the radial pressure gradient, the passage vortex structure, the vortex-endwall boundary layer interactions, and the losses.

A series of measurements were made simultaneously by using arrays of hot-wire anemometers with X-probes. The data show the rows consisting of doughnut-type large-scale vortices and frequent pairing, which results in larger vortices. The interaction of these vortices beyond the jet centerline breaks the doughnut-type large-scale vortices and forms three-dimensional medium-sized and small-sized vortices. The flow is randomized through this process. Some large-scale vortices continue to pair and form the configuration of counterrotating vortices approximately alternating on opposite sides of the jet centerline in the region far from the nozzle.

A supersonic radial flow in a disk channel is studied. Under the high stagnation pressure condition, effects of both the stagnation pressure and the channel height on the radial static pressure distribution are investigated. The pressure recovery through the pseudoshock, its length, the velocity profile and the thickness of the boundary layer were also measured. The results have shown that the supersonic region extends downstream with the increase of the stagnation pressure. However, the transition from the supersonic flow to subsonic flow occurs at the region further upstream than that predicted by the normal shock relation. The pressure recovery through the pseudoshock is found to be lower compared to that of a normal shock, particularly at a high, free-stream Mach number. In addition, the axially asymmetric form of the pseudoshock was observed. Furthermore, the measured static pressure, velocity distribution and the boundary layer thickness at the supersonic region agree well with the results of the two-dimensional calculation.

In multistage axial compressors used for gas turbine engines, it is important to understand unsteady behaviors such as surge and rotating stall. The purpose of this study is to develop a practical analytical method for both surge and rotating stall in axial compressors. In this paper, firstly, some characteristics of the unsteady phenomena in axial compressors derived from the measurements of test compressors are summarized. Secondly, a numerical method for the unsteady phenomena is described, assuming incompressible flow. A feature of the method is solving the fluid equations by Galerkin's method with the circumferential flow distortion expressed in the form of a high-order Fourier series. Finally, the usefulness of the method, using some results from parameter-vary computations and comparisons with the measured results in a 3-stage test compressor, is examined.

Viscous laminar two-dimensional hypersonic flows are simulated numerically by computation of the thin-layer Navier-Stokes equations. An upwinding technique is used with flux splitting for a perfect gas. Computed data are presented that emphasize the importance of the accuracy of the scheme and of the tightness of the mesh in the boundary layer. A comparison is also made with a boundary-layer calculation. Also, in the case of a mainly supersonic flow, the governing equations are made hyperbolic-parabolic in the flow direction, and the previous algorithm is transformed into a marching method in this direction.

Laser Doppler Velocimeter data, static pressure data, and smoke flow visualization data was obtained and analyzed to correlate with separation bubble data. The Eppler 387 airfoil was focused on at a chord Reynolds number of 100,000 and an angle of attack of 2 deg. Additional data was also obtained from the NACA 663-018 airfoil at a chord Reynolds number of 160,000 and an angle of attack of 12 deg. The structure and behavior of the transition separation bubble was documented along with the redeveloping boundary layer after reattachment over an airfoil at low Reynolds numbers. The understanding of the complex flow phenomena was examined so that analytic methods for predicting their formation and development can be improved. These analytic

### **WIND TUNNEL TEST OF CAD USB-STOL SEMI-BORNE PROTOTYPE**

MASAHITO OKUYAMA, HITOSHI TAKAHASHI, KAKUTOSHI FUJIEDA, TOSHIMI FUJITA, and AKIHITO IWASAKI Mar. 1987 34 p In JAPANESE (NAL-TM-566; ISSN-0452-2982; JTN-88-80061) Avail: NTIS HC A03/MF A01

The National Aerospace Laboratories (NAL) is researching and developing an experimental fan-jet Short Take-Off and Landing (STOL) plane. Aerodynamic research on the shape of the STOL plane was started in 1983. Research on aerodynamic elements was completed and the obtained results were fed to the existing Computer Aided Design (CAD). Based on its program, the shape of the main wing of the plane was designed. A prototype having the main wing shape obtained with CAD was fabricated during 1984 and 1985. Described here are the results of wind tunnel tests that were conducted to determine the basic aerodynamic characteristics of the prototype under the new design. Tests of each flap mode with no wind load, effects of Vortex Generator (VG) with no wind load, effects of a deflector nozzle, effects of the Upper Surface Blowing (USB) flap angle with ventilation, effects of front and rear flap angles, and VG effects with ventilation were analyzed. Data to determine the characteristics of the three longitudinal components of force during cruising, taking off and landing modes was also obtained. A comparison of the data with the experimental data of the STOL plane ASUKA was made.

### **ACOUSTIC-THERMAL ENVIRONMENT FOR USB FLAP STRUCTURE. REPORT 1: GROUND SIMULATION TEST RESULTS**

MASAAKI SANO, KOUICHI EGAWA, and SYUNJI ENDOH Jan. 1987 16 p In JAPANESE (NAL-TM-567; ISSN-0452-2982; JTN-88-80062) Avail: NTIS HC A03/MF A01

Upper Surface Blowing (USB) flap structure, which is one of the high-lift generating units in the low-noise Short Take-off and Landing (STOL) aircraft ASUKA, characteristically receives great thermal and acoustic loads. In terms of the design, an acoustic load test was made in the laboratory, with partial structure models to get various basic data. At the same time, it was confirmed that there was not any damage due to acoustic fatigue or harmful deformation. The design conditions of USB flap structure, however, were set under various hypothetical factors. Furthermore, the test conditions with the partial structure model were limited by a load device. For these reasons, it was necessary to obtain more accurate design data for acoustic fatigue-proof design. The USB flap acoustic and thermal environment and its structure response characteristics were measured, as part of the ground simulation test made in National Aerospace Laboratory (NAL) Kakuda Laboratory in November 1981 and September 1982 with a view to grasping the total characteristics of USB high-lift unit. In addition to the measurement results, the initial design conditions and partial structure model test results are evaluated. NASDA

### **COMPUTER SIMULATION OF AIRCRAFT AERODYNAMICS**

MAMORU INOUE Oct. 1989 11 p Presented at the 27th Aircraft Symposium, Fukuoka, Japan, 18-20 Oct. 1989; sponsored by Japan Society for Aeronautical and Space Sciences (NASA-TM-102221; A-89227; NAS 1.15:102221) Avail: NTIS HC A03/MF A01 CSCL 01A

The role of Ames Research Center in conducting basic aerodynamics research through computer simulations is described.

The computer facilities, including supercomputers and peripheral equipment that represent the state of the art, are described. The methodology of computational fluid dynamics is explained briefly. Fundamental studies of turbulence and transition are being pursued to understand these phenomena and to develop models that can be used in the solution of the Reynolds-averaged Navier-Stokes equations. Four applications of computer simulations for aerodynamics problems are described: subsonic flow around a fuselage at high angle of attack, subsonic flow through a turbine stator-rotor stage, transonic flow around a flexible swept wing, and transonic flow around a wing-body configuration that includes an inlet and a tail. THOMAS R. NORMAN and JEFFREY S. LIGHT Oct. 1989 20 p Presented at the 15th European Rotorcraft Forum, Amsterdam, Netherlands, 12-15 Sep. 1989 (NASA-TM-102222; A-89229; NAS 1.15:102222) Avail: NTIS HC A03/MF A01 CSCL 01A

The wide field shadowgraph technique is reviewed along with its application to the visualization of rotor wakes. In particular, current experimental methods and data reduction requirements are discussed. Sample shadowgraphs are presented. These include shadowgraphs of model-scale helicopter main rotors and tilt rotors, and full scale tail rotors, both in hover and in forward flight. Author

### **AN EXPERIMENTAL INVESTIGATION OF HELICOPTER ROTOR HUB FAIRING DRAG CHARACTERISTICS**

D. Y. SUNG, M. B. LANCE (Planning Research Corp., Hampton, VA.), L. A. YOUNG, and R. H. STROUB Sep. 1989 60 p (NASA-TM-102182; A-89096; NAS 1.15:102182) Avail: NTIS HC A04/MF A01 CSCL 01A

A study was done in the NASA 14- by 22-Foot Wind Tunnel at Langley Research Center on the parasite drag of different helicopter rotor hub fairings and pylons. Parametric studies of hub-fairing camber and diameter were conducted. The effect of hub fairing/pylon clearance on hub fairing/pylon mutual interference drag was examined in detail. Force and moment data are presented in tabular and graphical forms. The results indicate that hub fairings with a circular-arc upper surface and a flat lower surface yield maximum hub drag reduction; and clearance between the hub fairing and pylon induces high mutual-interference drag and diminishes the drag-reduction benefit obtained using a hub fairing with a flat lower surface. Test data show that symmetrical hub fairings with circular-arc surfaces generate 74 percent more interference drag than do cambered hub fairings with flat lower surfaces, at moderate negative angle of attack. A combined experimental and analytical investigation is being conducted to study advanced mixer-ejector exhaust systems. The program is designed to provide benchmark experimental data relative to several advanced mixer-ejector exhaust system configurations; in addition, analytical flowfield development and plume assessment calculations were performed. Exhaust mixing, ejector pumping, and the mixer-ejector exit plane 3-D velocity field was investigated. A slot nozzle ejector configuration was investigated under a gas dynamic research program, in order to provide a baseline with which to compare mixer-ejector results. The JETPATH code was used to calculate flowfield development downstream of the mixer-ejector for the purpose of generating aerodynamic input for plume assessment calculations. Plume assessment calculations were performed using the IPAT code. In addition, an experimental compressibility assessment of convoluted exhaust nozzle mixing effectiveness was performed. This involves low speed testing of an advanced mixer nozzle which was tested previously at a supersonic operating condition. The compressibility assessment assisted a parallel contract to develop improved prediction procedures for vortical flowfield development downstream of convoluted trailing edge configurations. GRA

This Data Item 89008, an addition to the Aerodynamics Subseries, uses data drawn from the literature to produce

semi-empirical correlations for the aerodynamic characteristics of cone and ogive forebodies, either sharp or with varying degrees of spherical blunting, on cylindrical afterbodies. The correlations provide the two slopes as the sum of three contributions: the inviscid loading distribution at angle of attack, the changes caused by the boundary layer displacement thickness, and the skin friction contribution. A fully turbulent boundary layer is assumed and the correlations are expected to apply to all axisymmetric forebody shapes whether or not there is a smooth-surface transition from the forebody to the cylinder. The correlations are presented graphically and the ranges of geometries and flow conditions studied are tabulated. Two worked examples illustrate their application in practice. ESDU

(DFVLR-FB-89-18; ISSN-0171-1342; ETN-89-95313) Avail:

NTIS HC A05/MF A01; DFVLR, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Federal Republic of Germany, 32 deutsche marks

The unsteady incompressible flow around oscillating jet engines and ring airfoils is analyzed numerically. A thin axisymmetric surface approximates the geometry, and the jet is simulated by a vortex cylinder. A new and efficient Fourier-panel method is derived by a Fourier decomposition of the flow which allows reduction of the problem by one dimension. A higher order vorticity distribution on the body represents the flow and extremely accurate results are obtained for a few panels. The unsteady flow is calculated with a time marching procedure. The influences of frequency diameter and jet on the unsteady forces and moments is investigated for jet engines and ring airfoils displaying harmonic heave and pitch oscillations. Empirical approximations valid for small diameters are derived. It is found that there are vanishing influences of the jet on the aerodynamic forces and only minor influences on the moments for engines with small diameters. Highly nonlinear influences of the jet and oscillation frequency appear with increasing diameter. The importance of these results in designing the extreme high-bypass engines of future aircraft is stressed. ESA

## 02 AERODYNAMICS

Aeronautics, Cranfield, Bedford MK43 0AL, England 7.50 Sterling pounds

Tests on a fineness ratio ogive-cylinder body made in a curved flow are described. Theoretical estimates are made of the aerodynamic characteristics of the model using the SPARV panel method, and slender-body and linear theory. The pressure distributions over the model are measured over a pitch range of -6.4 to 11.6 degrees measured relative to the nominal flow direction at the center of the model. The local loadings and overall loads are obtained by successive integration of the pressures. The experimental results show that unexpectedly high loadings are present over the whole of the afterbody and these dominate the aerodynamic characteristics giving high normal-force and a rearward centre of pressure position as compared with the results obtained from tests made in the straight flow provided by a windtunnel. ESA

### **RESEARCH IN NATURAL LAMINAR FLOW AND LAMINAR-FLOW CONTROL, PART 1**

JERRY N. HEFNER, comp. and FRANCES E. SABO, comp. Dec. 1987 322 p Symposium held in Hampton, VA, 16-19 Mar. 1987 (NASA-CP-2487-PT-1; L-16350-PT-1; NAS 1.55:2487-PT-1) Avail: NTIS HC A14/MF A02 CSCL 01/1

Since the mid 1970's, NASA, industry, and universities have worked together to conduct important research focused at developing laminar flow technology that could reduce fuel consumption for general aviation, commuter, and transport aircraft by as much as 40 to 50 percent. The symposium was planned in view of the recent accomplishments within the areas of laminar flow control and natural laminar flow, and the potential benefits of laminar flow technology to the civil and military aircraft communities in the United States. Included were technical sessions on advanced theory and design tool development; wind tunnel and flight research; transition measurement and detection techniques; low and high Reynolds number research; and subsonic and supersonic research.

### **LFC: A MATURING CONCEPT**

JOHN MORRIS In NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 1 p 45-51 Dec. 1987

(DOUGLAS-PAPER-7878) Avail: NTIS HC A14/MF A02 CSCL 01/1

The existence of both turbulent and laminar flow was known for a long time, but it was not until the middle of the last century that the first systematic tests with fluids were conducted to establish the physical relationships and governing laws. The importance of turbulent and laminar airflows in aeronautics was recognized as early as the 1930's, but actual laminar flow control (LFC) investigations were not undertaken until the 1940's. This overview briefly touches on some of the historical development of LFC leading up to current activities. It then examines the technical problems being addressed and potential long-term LFC applications. Past and current Douglas activities are examined and the required future testing involving hybrid laminar flow control (HLFC) is discussed. Author

Avail: NTIS HC A14/MF A02 CSCL 01/1

Progress is summarized from 1974 to the present in the practical application of laminar-flow control (LFC) to subsonic transport aircraft. Those efforts included preliminary design system studies of commercial and military transports and experimental investigations leading to the development of the leading-edge flight test article installed on the NASA JetStar flight test aircraft. The benefits of LFC on drag, fuel efficiency, lift-to-drag ratio, and operating costs are compared with those for turbulent flow aircraft. The current activities in the NASA Industry Laminar-Flow Enabling Technologies Development contract include summaries of activities in the Task 1 development of a slotted-surface structural concept using advanced aluminum materials and the Task 2 preliminary conceptual design study of global-range military hybrid laminar flow control (HLFC) to obtain data at high Reynolds numbers and at Mach numbers representative of long-range subsonic transport aircraft operation. **THE RIGHT WING OF THE LEFT AIRPLANE**

ARTHUR G. POWELL *In* NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 1 p 141-161 Dec. 1987

Avail: NTIS HC A14/MF A02 CSCL 01/1

The NASA Leading-Edge Flight Test (LEFT) program addressed the environmental issues which were potential problems in the application of Laminar Flow Control (LFC) to transport aircraft. These included contamination of the LFC surface due to dirt, rain, insect remains, snow, and ice, in the critical leading-edge region. Douglas Aircraft Company designed and built a test article which was mounted on the right wing of the C-140 JetStar aircraft. The test article featured a retractable leading-edge high-lift shield for contamination protection and suction through perforations on the upper surface for LFC. Following a period of developmental flight testing, the aircraft entered simulated airline service, which included exposure to airborne insects, heavy rain, snow, and icing conditions both in the air and on the ground. During the roughly 3 years of flight testing, the test article has consistently demonstrated laminar flow in cruising flight. The experience with the LEFT experiment was summarized with emphasis on significant test findings. The following items were discussed: test article design and features; suction distribution; instrumentation and transition point reckoning; problems and fixes; system performance and maintenance requirements. **BOUNDARY-LAYER RECEPTIVITY AND LAMINAR-FLOW AIRFOIL DESIGN**

EDWARD J. KERSCHEN *In* NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 1 p 273-287 Dec. 1987

Avail: NTIS HC A14/MF A02 CSCL 01/1

Boundary-layer receptivity examines the way in which external disturbances generate instability waves in boundary layers. Receptivity theory is complementary to stability theory, which studies the evolution of disturbances that are already present in the boundary layer. A transition prediction method which combines receptivity with linear stability theory would directly account for the influence of free-stream disturbances and also consider the characteristics of the boundary layer upstream of the neutral stability point. The current  $e^N$  transition prediction methods require empirical correlations for the influence of environmental disturbances, and totally ignore the boundary layer characteristics upstream of the neutral stability point. The regions where boundary-layer receptivity occurs can be separated into two classes, one near the leading edges and the other at the downstream points where the boundary layer undergoes rapid streamwise adjustments. Analyses were developed for both types of regions, and parametric studies which examine the relative importance of different mechanisms were carried out. The work presented here has focused on the low Mach number case. Extensions to high subsonic and supersonic conditions are presently underway. Author

Research in Natural Laminar Flow and Laminar-Flow Control, Part 1 p 289-300 Dec. 1987

Avail: NTIS HC A14/MF A02 CSCL 01/1

An effective computational scheme was developed to study the growth/damping of Goertler vortices along walls of variable curvature. Computational experiments indicate that when the amplification rates for the  $u$ -,  $v$ -, and  $w$ -perturbations are the same, the finite difference approach to solve the initial value problem and the normal mode approach give identical results for the Blasius boundary layer on constant curvature concave walls. The growth of Goertler vortices was rapid in the concave regions and was followed by sharp damping in the convex region. However, multiple sets of counter-rotating vortices were formed and remained far downstream in the convex region. The current computational scheme can be easily extended to more realistic problems including variable pressure gradients and suction effects. Author

**EXPERIMENTAL STUDIES ON GOERTLER VORTICES**

SIVA M. MANGALAM (Analytical Services and Materials, Inc., Hampton, VA.), J. RAY DAGENHART, and JIM F. MEYERS *In* its Research in Natural Laminar Flow and Laminar-Flow Control, Part 2 p 421-433 Dec. 1987

Avail: NTIS HC A15/MF A02 CSCL 01/1

Goertler vortices arise in laminar boundary layers along concave walls due to an imbalance between pressure and centrifugal forces. In advanced laminar-flow control (LFC) supercritical airfoil designs, boundary-layer suction is primarily used to control Tollmien-Schlichting instability and cross-flow vortices in the concave region near the leading edge of the airfoil lower surface. The concave region itself is comprised of a number of linear segments positioned to limit the total growth of Goertler vortices. Such an approach is based on physical reasonings but rigorous theoretical justification or experimental evidence to support such an approach does not exist. An experimental project was initiated at NASA Langley to verify this concept. In the first phase of the project an experiment was conducted on an airfoil whose concave

region has a continuous curvature distribution. Some results of this experiment were previously reported and significant features are summarized. Author

### AN EXPERIMENTAL EVALUATION OF SLOTS VERSUS POROUS STRIPS FOR LAMINAR-FLOW APPLICATIONS

KENNETH C. CORNELIUS *In* NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 2 p 435-451 Dec. 1987

Avail: NTIS HC A15/MF A02 CSCL 01/1

Detailed mean velocity and disturbance amplitude measurements were conducted in a Blasius boundary-layer flow with wall suction applied at three downstream locations. The main emphasis was a direct comparison of the growth rate of the instability wave with discrete spanwise slots versus wide porous strips. The results demonstrate that the local effects of suction through slots or very narrow porous strips have a greater beneficial effect on the stability of the boundary-layer flow relative to the suction influence of a wide porous strip. Codes which use continuous suction for the growth rates of the instability waves to determine the suction quantities for a multiple series of slots will be quite conservative in the estimation of the suction quantity. Guidelines were provided for suction-chamber design and flow rates to minimize internal oscillations which propagate into the boundary-layer flow. Author

### BOUNDARY-LAYER STABILITY ANALYSIS OF LANGLEY RESEARCH CENTER 8-FOOT LFC EXPERIMENTAL DATA

SCOTT BERRY (Analytical Services and Materials, Inc., Hampton, VA.), J. RAY DAGENHART, CUYLER W. BROOKS, JR., and CHARLES D. HARRIS *In* its Research in Natural Laminar Flow and Laminar-Flow Control, Part 2 p 471-489 Dec. 1987

Avail: NTIS HC A15/MF A02 CSCL 01/1

An analytical study of linear-amplifying instabilities of a laminar boundary layer as found in the experimental data of the LaRC/8-foot laminar-flow control (LFC) experiment was completed and the results are presented. The LFC airfoil used for this experiment was a swept, supercritical design which removed suction air through spanwise slots. The amplification of small disturbances by linear processes on a swept surface such as this can be due to either Tollmien-Schlichting (TS) and/or crossflow (CF) mechanisms. This study consists of the examination of these two instabilities by both the commonly used incompressible (SALLY and MARIA) analysis and the more involved compressible (COSAL) analysis. A wide range of experimental test conditions with variations in Mach number, Reynolds number, and suction distributions were available for this study. Experimentally

determined transition locations were found from thin-film techniques and were used to correlate the n-factors at transition for the range of test cases. Author

### THEORETICAL METHODS AND DESIGN STUDIES FOR NLF AND HLFC SWEEPED WINGS AT SUBSONIC AND SUPERSONIC SPEEDS

SURESH H. GORADIA (Vigyan Research Associates, Inc., Hampton, VA.) and HARRY L. MORGAN, JR. *In* its Research in Natural Laminar Flow and Laminar-Flow Control, Part 2 p 547-575 Dec. 1987

Avail: NTIS HC A15/MF A02 CSCL 01/1

Laminarization of the boundary layer on the surface of aircraft wings can be accomplished by the use of concepts such as Natural Laminar Flow (NLF), Laminar-Flow Control (LFC), and Hybrid Laminar-Flow Control (HLFC). Several integral boundary-layer methods were developed for the prediction of laminar, transition, and separating turbulent boundary layers. These methods were developed for use at either subsonic or supersonic speeds, have small computer execution times, and are simple to use. The theoretical equations and assumptions which form the basis of the boundary-layer method, are briefly outlined and the results of several correlation cases with exciting experimental data are presented. ### APPLICATION OF SOUND AND TEMPERATURE TO CONTROL BOUNDARY-LAYER TRANSITION

LUCIO MAESTRELLO, PARESH PARIKH, A. BAYLISS (Northwestern Univ., Evanston, IL.), L. S. HUANG, and T. D. BRYANT *In* its Research in Natural Laminar Flow and Laminar-Flow Control, Part 2 p 593-616 Dec. 1987

Avail: NTIS HC A15/MF A02 CSCL 01/1

The growth and decay of a wave packet convecting in a boundary layer over a concave-convex surface and its active control by localized surface heating are studied numerically using direct computations of the Navier-Stokes equations. The resulting sound radiations are computed using linearized Euler equations with the pressure from the Navier-Stokes solution as a time-dependent boundary condition. It is shown that on the concave portion the amplitude of the wave packet increases and its bandwidth broadens while on the convex portion some of the components in the packet are stabilized. The pressure field decays exponentially away from the surface and then algebraically, exhibiting a decay characteristic of acoustic waves in two dimensions. The far-field acoustic behavior exhibits a super-directivity type of behavior with a beaming downstream. Active control by surface heating is shown to reduce the growth of the wave packet but have little effect on acoustic far field behavior for the cases considered. Active control by sound emanating from the surface of an airfoil in the vicinity of the leading edge is experimentally investigated. The purpose is to control the separated region at high angles of attack. The results show that injection of sound at shedding frequency of the flow is effective in an increase of lift and reduction of drag. Author

### RESEARCH IN NATURAL LAMINAR FLOW AND LAMINAR-FLOW CONTROL, PART 3

JERRY N. HEFNER, comp. and FRANCES E. SABO, comp. Dec. 1987 399 p Symposium held in Hampton, VA, 16-19 Mar. 1987

(NASA-CP-2487-PT-3; L-16350-PT-3; NAS 1.55:2487-PT-3)

Avail: NTIS HC A17/MF A03 CSCL 01/1

Part 3 of the Symposium proceedings contains papers addressing advanced airfoil development, flight research experiments, and supersonic transition/laminar flow control research. Specific topics include the design and testing of natural laminar flow (NLF) airfoils, NLF wing gloves, and NLF nacelles; laminar boundary-layer stability over fuselage forebodies; the design

of low noise supersonic/hypersonic wind tunnels; and boundary layer instability mechanisms on swept leading edges at supersonic speeds.

**DESIGN OF THE LOW-SPEED NLF(1)-0414F AND THE HIGH-SPEED HSNLF(1)-0213 AIRFOILS WITH HIGH-LIFT SYSTEMS**

JEFFREY K. VIKEN, SALLY A. WATSON-VIKEN, WERNER PFENNIGER (Analytical Services and Materials, Inc., Hampton, VA.), HARRY L. MORGAN, JR., and RICHARD L. CAMPBELL *In its* Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 637-671 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

The design and testing of Natural Laminar Flow (NLF) airfoils is examined. The NLF airfoil was designed for low speed, having a low profile drag at high chord Reynolds numbers. The success of the low speed NLF airfoil sparked interest in a high speed NLF airfoil applied to a single engine business jet with an unswept wing. Work was also conducted on the two dimensional flap design. The airfoil was decambered by removing the aft loading, however, high design Mach numbers are possible by increasing the aft loading and reducing the camber overall on the airfoil. This approach would also allow for flatter acceleration regions which are more stabilizing for cross flow disturbances. Sweep could then be used to increase the design Mach number to a higher value also. There would be some degradation of high lift by decambering the airfoil overall, and this aspect would have to be considered in a final design.

**WIND TUNNEL RESULTS OF THE LOW-SPEED NLF(1)-0414F AIRFOIL**

DANIEL G. MURRI, ROBERT J. MCGHEE, FRANK L. JORDAN, JR., PATRICK J. DAVIS, and JEFFREY K. VIKEN (Mandex, Inc., Falls Church, VA.) *In its* Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 673-696 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

The large performance gains predicted for the Natural Laminar Flow (NLF)(1)-0414F airfoil were demonstrated in two-dimensional airfoil tests and in wind tunnel tests conducted with a full scale modified Cessna 210. The performance gains result from maintaining extensive areas of natural laminar flow, and were verified by flight tests conducted with the modified Cessna. The lift, stability, and control characteristics of the Cessna were found to be essentially unchanged when boundary layer transition was fixed near the wing leading edge. These characteristics are very desirable from a safety and certification view where premature boundary layer transition (due to insect contamination, etc.) must be considered. The leading edge modifications were found to enhance the roll damping of the Cessna at the stall, and were therefore considered effective in improving the stall/departure resistance. Also, the modifications were found to be responsible for only minor performance penalties.

WILLIAM G. SEWALL, ROBERT J. MCGHEE, DAVID E. HAHNE, and FRANK L. JORDAN, JR. *In its* Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 697-726 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

Wind tunnel tests were conducted to evaluate a natural laminar flow airfoil designed for the high speed jet aircraft in general aviation. The airfoil, designated as the High Speed Natural Laminar Flow (HSNLF)(1)-0213, was tested in two dimensional wind tunnels to investigate the performance of the basic airfoil shape. A three dimensional wing designed with this airfoil and a high lift flap system is also being evaluated with a full size, half span model.

**DESIGN AND TEST OF A NATURAL LAMINAR FLOW/LARGE REYNOLDS NUMBER AIRFOIL WITH A HIGH DESIGN CRUISE LIFT COEFFICIENT**

C. E. KOLESAR *In* NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 727-751 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

Research activity on an airfoil designed for a large airplane capable of very long endurance times at a low Mach number of 0.22 is examined. Airplane mission objectives and design optimization resulted in requirements for a very high design lift coefficient and a large amount of laminar flow at high Reynolds number to increase the lift/drag ratio and reduce the loiter lift coefficient. Natural laminar flow was selected instead of distributed mechanical suction for the measurement technique. A design lift coefficient of 1.5 was identified as the highest which could be achieved with a large extent of laminar flow. A single element airfoil was designed using an inverse boundary layer solution and inverse airfoil design computer codes to create an airfoil section that would achieve performance goals. The design process and results, including airfoil shape, pressure distributions, and aerodynamic characteristics are presented. A two dimensional wind tunnel model was constructed and tested in a NASA Low Turbulence Pressure Tunnel which enabled testing at full scale design Reynolds number. A comparison is made between theoretical and measured results to establish accuracy and quality of the airfoil design technique.

**EXPERIMENTAL AND NUMERICAL ANALYSES OF LAMINAR BOUNDARY-LAYER FLOW STABILITY OVER AN AIRCRAFT FUSELAGE FOREBODY**

PAUL M. H. W. VIJGEN (Kansas Univ., Lawrence.) and BRUCE J. HOLMES *In its* Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 861-886 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

Fuelled by a need to reduce viscous drag of airframes, significant advances have been made in the last decade to design lifting surface geometries with considerable amounts of laminar flow. In contrast to the present understanding of practical limits for natural laminar flow over lifting surfaces, limited experimental results are available examining applicability of natural laminar flow over axisymmetric and nonaxisymmetric fuselage shapes at relevantly high length Reynolds numbers. The drag benefits attainable by realizing laminar flow over nonlifting aircraft components such as fuselages and nacelles are shown. A flight experiment to investigate transition location and transition mode over the forward fuselage of a light twin engine propeller driven airplane is examined.

**SUPERSONIC LAMINAR-FLOW CONTROL**

DENNIS M. BUSHNELL and MUJEEB R. MALIK (High Technology Corp., Hampton, VA.) *In its* Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 923-946 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

Detailed, up to date systems studies of the application of laminar flow control (LFC) to various supersonic missions and/or vehicles, both civilian and military, are not yet available. However, various first order looks at the benefits are summarized. The bottom line is that laminar flow control may allow development of a viable second generation SST. This follows from a combination of reduced fuel, structure, and insulation weight permitting operation at higher altitudes, thereby lowering sonic boom along with improving performance. The long stage lengths associated with the emerging economic importance of the Pacific Basin are creating a serious and renewed requirement for such a vehicle. Supersonic LFC techniques are discussed.

**THE EFFECTS OF WALL SURFACE DEFECTS ON BOUNDARY-LAYER TRANSITION IN QUIET AND NOISY SUPERSONIC FLOW**

E. LEON MORRISSETTE and THEODORE R. CREEL, JR. *In its Research in Natural Laminar Flow and Laminar-Flow Control*, Part 3 p 965-980 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

The design of supersonic vehicles with laminar flow control and vehicles such as the Space Shuttle requires information on allowable transition tolerances to fabrication defects such as discrete surface roughness and waviness. A relatively large data base on the effects of discrete roughness on transition exists for subsonic and supersonic speeds. The existing supersonic wind tunnel transition data are contaminated by wind tunnel noise emanating from the turbulent boundary layers on the nozzle walls. Roughness and waviness transition data obtained in a quiet Mach 3.5 supersonic wind tunnel are compared with those obtained in conventional noisy flows. Author

**EXPERIMENTAL AND THEORETICAL INVESTIGATION OF BOUNDARY-LAYER INSTABILITY MECHANISMS ON A SWEEPED LEADING EDGE AT MACH 3.5**

THEODORE R. CREEL, JR., MUJEEB R. MALIK (High Technology Corp., Hampton, VA.), and IVAN E. BECKWITH *In its Research in Natural Laminar Flow and Laminar-Flow Control*, Part 3 p 981-995 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

A brief outline of the experimental and theoretical investigation of boundary layer instability mechanisms on a swept leading edge at Mach 3.5 is presented. Transition is affected by wind tunnel noise only when roughness is present. Local  $\text{bar-R}_{\text{sub}} \cdot \text{Reynolds}$  number and  $k/\eta_{\text{sub}} \cdot \text{Reynolds}$  are useful correlation parameters for a wide range of free stream Mach numbers. Stability theory is in good agreement with the experimental cross flow vortex wavelength. These conclusions are briefly discussed. Author

**SUPERSONIC BOUNDARY-LAYER TRANSITION ON THE LARC F-106 AND THE DFRF F-15 AIRCRAFT. PART 1: TRANSITION MEASUREMENTS AND STABILITY ANALYSIS**

FAYETTE S. COLLIER, JR., JOSEPH B. JOHNSON, OLLIE J. ROSE (PRC Kentron, Inc., Hampton, VA.), and D. S. MILLER *In its Research in Natural Laminar Flow and Laminar-Flow Control*, Part 3 p 997-1014 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

For the case of the F-15 flight tests, boundary layer transition was observed up to Mach numbers of 1.2. For very limited and specific flight conditions, laminar flow existed back to about 20 percent chord on the surface clean up glove. Hot film instrumentation was effective for locating the region of transition. For the F-106 flight tests, transition on the wing or vertical tail generally occurred very near the attachment line. Transition was believed to be caused by either attachment line contamination or strong cross flow development due to the high sweep angles of the test articles. The compressibility analysis showed that cross flow N-factors were in the range of 5 to 12 at transition. Author

OLLIE J. ROSE (PRC Kentron, Inc., Hampton, VA.) and D. S. MILLER *In its Research in Natural Laminar Flow and Laminar-Flow Control*, Part 3 p 1015-1024 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/1

In the leading edge region, the measured pressure distributions exhibit extreme variations from strong suction peaks to a pressure

maximum at the attachment line. These variations occur over short distances on the wing surface, and their character changes with changes in Mach number and angle of attack. The data/theory comparisons show that the character of the measured pressure distributions is well predicted for every Mach number and/or angle of attack condition considered. There is good agreement between theory and experiment for the location of the attachment line and suction peaks. The pressure magnitudes are well represented in the critical leading edge region, including the pressure maximum on the attachment line. The wing/body/inlet results agree well with the wing alone back to about 20 percent of chord where the upper surface suction peak typically occurs. The largest differences between theory and measurement always occur in the vicinity of suction peaks, with the difference being approximately 15 percent or less. In regions of largest error, the predicted pressures underestimate the suction peak strength for each case considered. The ability of the NCOREL code to reproduce wing pressure characteristics is shown. Author

**PREDICTION OF UNSTEADY BLADE SURFACE PRESSURES ON AN ADVANCED PROPELLER AT AN ANGLE OF ATTACK**

M. NALLASAMY (Sverdrup Technology, Inc., Cleveland, OH.) and J. F. GROENEWEG Nov. 1989 28 p Presented at the 12th Aeroacoustics Conference, San Antonio, TX, 10-12 Apr. 1989; sponsored by AIAA Previously announced in IAA as A89-40473 (Contract NAS3-25266)

(NASA-TM-102374; E-5108; NAS 1.15:102374; AIAA-89-1060)

Avail: NTIS HC A03/MF A01 CSCL 01/1

The numerical solution of the unsteady, three-dimensional, Euler equations is considered in order to obtain the blade surface pressures of an advanced propeller at an angle of attack. The specific configuration considered is the SR7L propeller at cruise conditions with a 4.6 deg inflow angle corresponding to the plus 2 deg nacelle tilt of the Propeller Test Assessment (PTA) flight test condition. The results indicate nearly sinusoidal response of the blade loading, with angle of attack. For the first time, detailed variations of the chordwise loading as a function of azimuthal angle are presented. It is observed that the blade is lightly loaded for part of the revolution and shocks appear from hub to about 80 percent radial station for the highly loaded portion of the revolution. Author

**SOME OBSERVATIONS ON TRANSITORY STALL IN CONICAL DIFFUSERS**

K. B. M. Q. ZAMAN and M. D. DAHL 1989 13 p Presented at the 28th Aerospace Sciences Meeting, Reno, NV, 8-11 Jan. 1990; sponsored by AIAA

(NASA-TM-102387; E-5128; NAS 1.15:102387; AIAA-90-0048)

Avail: NTIS HC A03/MF A01 CSCL 01/1

Results from an experimental investigation on the flow through conical diffusers are presented. The mean and fluctuating velocity fields are compared for three diffusers with total diffusion angles of 16, 20 and 24 degrees, in the throat Mach number ( $M_{\text{sub } t}$ ) range of 0.05 to 0.95. Each of the diffusers were 14 cm long and had a 5.08 cm inlet diameter, and the flow exited into the ambient. The boundary layer at the throat was thin with the throat diameter ( $D_{\text{sub } t}$ ) to momentum thickness ( $O$ ) ratio being as high as 800 at  $M_{\text{sub } t} = 0.4$ . While the 16 deg diffuser flow exited with a top-hat mean velocity profile, increasing losses due to increasing separation resulted in fuller profiles for the 20 and 24 degree cases. A detailed flow field study was conducted for the 16 deg diffuser. The  $u'$ -spectrum, measured at the exit plane, exhibited a peak apparently due to the ensuing jet column instability throughout the  $M_{\text{sub } t}$  range covered. In addition, a much lower frequency spectral peak also occurred in the  $M_{\text{sub } t}$  range of 0.3 to 0.7. Both of the spectral peaks were due to axisymmetric flow fluctuations. A self-sustaining flow oscillation occurred in the  $M_{\text{sub } t}$  range of 0.6 to 0.85, emitting a loud tone, when the jet column instability frequency matched the resonance frequency of the

diffuser. Limited data showed that artificial acoustic excitation was effective in reducing the flow fluctuations, with a resultant increase in the pressure recovery, at low  $M(\text{sub } t)$ . Author

**IMPROVEMENTS IN THE FORMULATIONS AND NUMERICAL SOLUTION OF THE EULER PROBLEM FOR SWEEP WINGS**

M. F. PAISLEY and M. G. HALL 17 Aug. 1988 14 p Presented at the IUTAM Symposium Transsonicum 3, Goettingen, Fed. Republic of Germany, 24-27 May 1988 (RAE-TM-AERO-2139; BR108362; ETN-89-94829) Copyright Avail: NTIS HC A03/MF A01

A method to calculate steady inviscid transonic flow for swept wings is described. It is based on a multigrid cell vertex finite volume Euler method. The effect of velocity perturbations generated from Klunker's analytic asymptotic solution to the transonic small disturbance equation, is applied. The geometry of the wing tip is modeled with three successively finer C-O grids. The results show marked differences in comparison with those obtained on C-H grids. The results indicate that a shock wave mechanism can contribute to the generation of tip vortices in compressible inviscid flow. For reliable prediction of wing performance the importance in good modeling of both the wing tip geometry and the flow around the tip is shown. ESA

**DEVELOPMENT OF A VSAERO (VORTEX SEPARATION AERODYNAMICS) MODEL OF THE F/A-18**

R. TOFFOLETTO Mar. 1989 29 p (AD-A212442; ARL-FLIGHT-MECH-TM-404; DODA-AR-005-543) Avail: NTIS HC A03/MF A01 CSCL 01/1

Vortex Separation AEROdynamics (VSAERO) was used to produce an aerodynamic model of the aircraft. When fully developed, results from the model will be compared with results obtained from experiments planned to be carried out in the ARL

wind tunnel. The velocity field and wake geometry in the vicinity of the aircraft, and the pressure distribution on the aircraft were calculated for various flight conditions. Calculated lift coefficients for the whole aircraft were compared with wind tunnel results obtained from McDonnell Aircraft company. The model was also used to study the effect of engine intake velocity on the aerodynamics of the aircraft. The major problem encountered during the development of the model was a numerical instability caused by the complicated vortex/vortex and vortex/body interactions in the vicinity of the tail of the aircraft. During this time, a new version of VSAERO was installed at ARL which promised greater stability in this area. It also allowed for a denser grid in the wake structure. Comparisons were made between the old and new versions to determine the extent of the improvements. GRA

**CHORDWISE LOADING AND CAMBER FOR TWO-DIMENSIONAL THIN SECTIONS**

MICHAEL MACKAY Aug. 1989 20 p (AD-A213318; DREA-TM-89/219) Avail: NTIS HC A03/MF A01 CSCL 01/1

Derivations are given for the calculation of section camberline from a given segmented chordwise load distribution, and for the inverse problem. In both cases, the algorithms are exact within the limits of thin wing theory. Two dimensional, thin, lifting sections were studied and the derivation is given of the camberline from a segmented chordwise loading (the design problem) and the calculation of loading from a discretely-defined camberline (the analysis problem). To the author's knowledge, these derivations have not been published for the general case, although the results for some specific cases are well known, good examples are the NACA a-series camberlines, obtained from simple two-segment load distributions, which have been widely used for many years. **AIRCRAFT AND GROUND VEHICLE FRICTION MEASUREMENTS OBTAINED UNDER WINTER RUNWAY CONDITIONS**

THOMAS J. YAGER (NASA, Langley Research Center, Hampton, VA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 7 p. refs (SAE PAPER 891070) Copyright

Tests with specially instrumented NASA B-737 and B-727 aircraft together with several different ground friction measuring devices have been conducted for a variety of runway surface types and wetness conditions. This effort is part of the Joint FAA/NASA Aircraft/Ground Vehicle Runway Friction Program aimed at obtaining a better understanding of aircraft ground handling performance under adverse weather conditions, and defining relationships between aircraft and ground vehicle tire friction measurements. Aircraft braking performance on dry, wet, snow-, and ice-covered runway conditions is discussed together with ground vehicle friction data obtained under similar runway conditions. For the wet, compacted snow- and ice-covered runway conditions, the relationship between ground vehicles and aircraft friction data is identified. The influence of major test parameters on friction measurements such as speed, test tire characteristics, and surface contaminant-type are discussed. The test results indicate that use of properly maintained and calibrated ground

### 03 AIR TRANSPORTATION AND SAFETY

vehicles for monitoring runway friction conditions should be encouraged particularly under adverse weather conditions.

Previous research has produced a real-time, three dimensional, interactive moving platform simulator (MPS). The simulator utilizes Defense Mapping Agency digital terrain elevation data to generate the three dimensional terrain and runs on Silicon Graphics, Inc. IRIS 4D/70GT graphics workstations. The MPS system was used as a basis for a variety of military applications. The modifications of the MPS system for use as a crash investigation tool for the U.S. Army aircraft mishaps are presented. Flight recorder data from the mishap aircraft is used to graphically reconstruct the flight of the aircraft. Flight attitudes, gauge readings, switch positions, warning and advisory light indicators, and flight control inputs are displayed. The visualization of the flight recorder data greatly aids in the analysis of the causes of an aircraft mishap.

(CAA-PAPER-88014; ETN-89-95535) Copyright Avail: Civil Aviation Authority, Greville House, 37 Gratton Road, Cheltenham, United Kingdom, 10 sterling pounds

Tests carried out using a fully furnished Trident aircraft to determine the effectiveness of an interior water spray system in preserving a survivable cabin environment in the face of an external fuel fire are described. The water spray system should delay penetration of an external fire, minimize the combustion of cabin furnishings, prevent the buildup of unsurvivable temperatures within the cabin, and delay the transfer of combustion products, including toxic gases into the occupied areas of the cabin. In three tests, during which the aircraft structure suffered increasing external damage, the water spray prevented fire damage in the cabin and delayed the migration of toxic fumes.

##### A TEST OF AIRBORNE KINEMATIC GPS POSITIONING FOR AERIAL PHOTOGRAPHY - METHODOLOGY

G. KEEL, H. JONES, and G. LACHAPPELLE (Nortech Surveys /Canada/, Inc., Calgary) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 147-151. refs

The feasibility of using satellite GPSs for real-time three-dimensional aircraft positioning during photogrammetric surveys was investigated experimentally. The main test equipment comprised: (1) a twin-engine aircraft with a GPS receiver operating in differential mode with a 15-Hz bandwidth, a photogrammetric camera, and a computer-addressable precision timing system (CAPTS) to time the shutter openings; and (2) a ground monitor station with GPS receiver in 8-Hz-bandwidth mode and a CAPTS to permit calibration of the time delay between GPS time and exposure time. Postflight data reduction was performed using a modified version of the HYDROSTAR package (Lachapelle et al., 1988); the results are presented in tables and discussed in detail. The errors in the GPS positions were found to be less than 1 m in all three coordinates, demonstrating the suitability of GPS for cost-effective real-time application. T.K.

#### A90-13983#

##### A TEST OF KINEMATIC GPS COMBINED WITH AERIAL PHOTOGRAPHY - ORGANIZATION, LOGISTICS AND RESULTS

RICHARD MOREAU (Ministere de l'Energie et des Ressources, Sainte-Foy, Canada) and MICHEL PERRON (Hauts-Monts, Inc., Beauport, Canada) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 153-158. refs

Results are reported from experimental trials conducted in Quebec to assess the feasibility of using satellite GPSs for real-time three-dimensional aircraft positioning during photogrammetric surveys, as described by Keel et al. (1989). A twin-engine aircraft equipped with a differential-mode GPS receiver, a photogrammetric camera, and a precision timing system flew within 20 km of a ground monitor station with a GPS receiver and an identical timing system. The organization of the test and details of the postflight data reduction are discussed, and the results are presented in tables. It is shown that the GPS position errors were less than 1 m in all three coordinates, demonstrating the ability of kinematic GPS to eliminate the need for ground control during 1:20,000 mapping operations. T.K.

##### AVIONIC SYSTEM BASED ON GLOBAL NAVIGATIONAL SATELLITE SYSTEM

S. FRED SINGER (DOT, Washington, DC) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 175, 176.

The design concept of an avionics package integrating five different satellite-GPS-based functions is briefly outlined. The basic advantages of a fully operational Navstar GPS are reviewed, including global coverage, three-dimensional position and velocity measurement, and accuracy, and it is suggested that an integrated GPS avionics package could provide enhanced performance and high reliability, with significant savings in hardware cost and weight. The GPS functions described are (1) navigation, (2) automatic dependent surveillance en route and near airports, (3) TCAS, (4) precision landings (using a differential-GPS landing system), and (5) in situ windshear detection and escape guidance. T.K.

#### A90-13985#

##### AUTOLANDING WITH GPS

B. W. PARKINSON and K. T. FITZGIBBON (Stanford University, CA) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 177-185. refs

The feasibility of a GPS-based automatic landing system (ALS) is investigated by means of numerical simulations. The FAA landing requirements are reviewed; the velocity-sensing capabilities of Navstar-GPS are summarized; a GPS error model is constructed from test measurements on a 5-channel receiver; the principles of differential GPS (DGPS) operation are explained; and particular attention is given to the design concept of a GPS-based onboard ALS. Results from simulations of glide-slope and flare phases with conventional GPS or DGPS, integral-control-law (ICL) or LQG regulators, and windless or windy conditions are presented in tables and graphs and discussed in detail. It is found that conventional GPS with the current satellite configuration is adequate only for nonprecision landings, whereas DGPS with one pseudolite could satisfy FAA category II and DGPS with two pseudolites could satisfy category III. The ICL controller provides better performance than the LQG controller under windy conditions. T.K.

##### GPS: ARRIVAL IN THE FLEET - A GPS AN/SRN-25 RECEIVER ASSESSMENT

PETER J. KARGZ (Vitro Corp., Arlington, VA) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 221-225.

Results are reported from performance tests on the AN/SRN-25 (V), an integrated Transit/Omega receiver with Navstar-GPS capability being used by the U.S. Navy. The operational requirements for the receiver are reviewed, and typical fleet GPS utilizations are described. The system static and dynamic testing program demonstrated that the AN/SRN-25 (V) met all Navy specifications, and interviews with personnel indicate that it is considered a valuable, user-friendly real-time navigation aid. Position accuracy of 17 m or better and average availability of about 12 h/day are reported. T.K.

##### INTEGRATION OF GPS WITH THE CARRIER AIRCRAFT INERTIAL NAVIGATION SYSTEM (CAINS)

WILLIAM A. CHITTICK (U.S. Navy, Naval Avionics Center, Indianapolis, IN) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 227-235.

The Carrier Aircraft Inertial Navigation System (CAINS) AN/ASN-130A is the U.S. Navy standard INS used in the F/A-18, AV-8B, and EA-6B aircraft. Data exchange between the GPS receiver and INS is accomplished with each acting as a remote terminal on an MIL-STD-1553 bus. The operational flight program of CAINS was modified to use the GPS background navigation output, in the closed-loop (feedback) mechanization. CAINS uses GPS reference data to perform both in-flight alignment on a moving platform (shipboard or airborne) and hybrid navigation. Test results are included which show the INS calibration benefits of the closed-loop mechanization and the resulting INS performance during GPS outages. Author

#### FLIGHT DEMONSTRATION OF TWO AND THREE SATELLITE NAVIGATION

RONALD B. DAYTON, JOHN T. NIELSON, and RICHARD F. NOLTING (Boeing Aerospace, Seattle, WA) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 259-266.

A modification of a GPS receiver/processor unit designed for operation in an under-determined state with two or three satellites has been evaluated. It is found that the use of an atomic clock of sufficient stability and a radar altimeter of sufficient accuracy with the modified receiver can effectively increase the GPS operating time by continuing to track down to two satellites following operation with four or three satellites. The feasibility and utility of a combination of a cesium clock and a radar altimeter have been demonstrated in a flight test. The test system, test conditions, and the results obtained are discussed. V.L.

#### INTEGRATED NAVIGATION SYSTEM DESIGN AND PERFORMANCE WITH PHASE III GPS USER EQUIPMENT

P. SINHA, K. BARCKLEY, and D. DEDOES IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 283-300. refs

The paper presents two ways of utilizing GPS position, velocity, and time data to maintain the system navigation solution. These include periodic reinitialization of the Inertial Navigation System solution to the GPS and measurements to a navigation filter resident in the mission computer. Pertinent closed loop design issues are discussed and the performance of both the user equipment and the system navigation solutions is demonstrated. K.K.

### A90-14001#

#### ACCURACY CONSIDERATIONS FOR GPS TSPI SYSTEM DESIGN

CARL HOFFENER and ROBERT J. VAN WECHER (Interstate Electronics Corp., Anaheim, CA) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 329-332. refs

GPS has become popular as a time and space-position information (TSPI) source on tracking ranges because it offers a potentially more accurate and more versatile tracking technique than radar. As GPS tends to be a complex navigation system, there are many potential error sources that must be considered. When using GPS for a range instrumentation tool, many of the potential error sources can be eliminated or minimized because it is being used in a confined preestablished area, and it can be utilized at selected predetermined times. All these factors can help in optimizing the accuracies obtained from a GPS system when utilized for TSPI on the ranges. Each of the major GPS error sources is defined, and proposed methods of compensation are discussed. Expected accuracies for typical system configurations are presented. Author

#### LORAN-AIDED GPS INTEGRITY

R. GROVER BROWN and PAUL W. MCBURNEY (Iowa State University of Science and Technology, Ames) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 461-466. Research sponsored by Iowa State University of Science and Technology. refs

One-way ranging on Loran-C stations is suggested as another

way of bringing in additional measurement information. Gaps in GPS Receiver Autonomous Integrity Monitoring (RAIM) availability are described, and solutions to these gaps are discussed. Simulation results of this Loran-aided GPS integrity concept are reported. C.D.

### A90-14357

#### MODE S TRANSPONDERS - A NEW AVIONICS PRODUCT

JOHN E. BROWN (Bendix/King, Olathe, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 13 p.

(SAE PAPER 891055) Copyright

The FAA's plan for modernization of the National Airspace System entails the adoption of Mode S transponders that are compatible with the new Air Traffic Control Radar Beacon System (ATCRBS); Mode S units will possess all the features of Mode A and Mode C ATCRBS transponders, while also incorporating an additional receiver, a switching duplexer, DPSK demodulation, and digital circuits to handle Mode S processing requirements. The Mode S data link will allow transmissions of ATC and air-to-air data exchanges for collision avoidance; such additional flight advisory services as weather reports and Automatic Terminal Information System broadcasts can be furnished to a cockpit display via this data link. O.C.

#### ACCELERATION, GAMMA, AND THETA GUIDANCE FOR ABORT LANDING IN A WINDSHEAR

A. MIELE, T. WANG (Rice University, Houston, TX), W. W. MELVIN (Delta Air Lines, Inc., Atlanta, GA), and R. L. BOWLES (NASA, Langley Research Center, Hampton, VA) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 12, Nov.-Dec. 1989, p. 815-821. Research supported by the Boeing Commercial Airplane Co., and Air Line Pilots Association. refs

(Contract NAG1-516)  
Copyright

This paper is concerned with the guidance of abort landing trajectories in a windshear. First, optimal trajectories are determined by minimizing the peak value of the altitude drop. Then, two guidance schemes, approximating the optimal trajectories, are developed: acceleration guidance (based on the relative acceleration) and gamma guidance (based on the absolute path inclination). From numerical experiments, it appears that both the acceleration guidance and the gamma guidance yield trajectories that are close to the optimal trajectory. In addition, a theta guidance scheme (modified constant pitch guidance) is developed that is superior to the constant pitch guidance in terms of the altitude loss and the survival capability in severe windshears. #### GPS MONITOR ALARM LIMITS FOR NONPRECISION APPROACHES

ROBERT LOH (Mitre Corp., McLean, VA) Navigation (ISSN 0028-1522), vol. 36, Fall 1989, p. 253-263. refs

Copyright

The future navigation accuracy requirement for nonprecision approaches has been estimated to be 100 m. GPS can satisfy this requirement by limiting the 95 percent horizontal position determination accuracy for civil users to 100 m. The FAA is investigating GPS signal integrity monitoring and the associated monitor alarm limits in order to satisfy the integrity response time

requirements for nonprecision approaches. This paper documents a rationale for the 100 m GPS horizontal accuracy requirement and evaluates the impact of using GPS monitor alarm limits greater than 100 m. The GPS monitor alarm limit must be set above 100 m in order to reduce the number of potential alarms. The significant impact on nonprecision approaches, as defined in the Terminal Instrument Procedures, appears to be the size of the obstacle clearance areas and their effect on the minimum descent altitude.

NTIS HC A03/MF A01 CSCL 01/5

During busy periods at major airports, inbound aircraft have to queue for use of the landing runway. In future air traffic systems it is likely that controllers will be able to make use of computer-proposed landing sequences and speed control advice. One proposed method for allocating aircraft landing times in such systems is the Time Horizon method. According to this method, a preferred landing time is calculated for each aircraft some way out from the airport, and a planned landing time is allocated at a fixed time before the aircraft's preferred landing time. This memorandum reports on a computer simulation study to demonstrate and quantify the effect of the time horizon method.

The results of a field trial to measure the effects upon Heathrow, London, of raising the transition altitude above 6000 ft. are described. The effects were simulated by sterilizing the minimum stack level in the Heathrow stacks for a period from 27 Jun. until 22 Jul. 1988. Subjective opinion was divided as to how much the inbound traffic was penalized. Measurements showed there was very little effect. The questionnaires used for the subjective opinion data are included, as are numerical results recorded during the trial period. The trial period was interrupted for 40 period of the time due to heavy impending traffic.

**PARALLEL APPROACH SEPARATION AND CONTROLLER PERFORMANCE: A STUDY OF THE IMPACT OF TWO SEPARATION STANDARDS**

EARL S. STEIN Nov. 1989 99 p  
(Contract F2006D)  
(DOT/FAA/CT-TN89/50) Avail: NTIS HC A05/MF A01

A small sample study of the possible impact of altering the separation minimum between aircraft approaches to dependent parallel runways is described. The current standard is 2 nautical miles (nmi) and the proposed new standard is 1.5 nmi. Four full performance level air traffic controllers participated in 12 hours of simulated air traffic control activity in which separation standards were altered in a balanced fashioned after each 1 hour block of simulation. Data were collected on multiple airspace and operator performance variables. Also collected were workload and observer estimates. The goal was to determine if system performance could be improved without compromising safety. Results indicated an increased frequency of landings using the 1.5 nmi standard indicating a finite increase in airport capacity. There were no indications of reduced safety or increased operator workload. Since the data were generated based on a small sample, results should be considered indicative rather than conclusive.

#### IMPACT EVALUATION OF COMPOSITE FLOOR SECTIONS

RICHARD L. BOITNOTT (NASA, Langley Research Center; U.S. Army, Army Aviation Research and Technology Activity, Hampton, VA) and EDWIN L. FASANELLA (Planning Research Corp., Hampton, VA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 17 p. refs  
(SAE PAPER 891018) Copyright

Graphite-epoxy floor sections representative of aircraft fuselage construction were statically and dynamically tested to evaluate their response to crash loadings. These floor sections were fabricated using a frame-stringer design typical of present aluminum aircraft without features to enhance crashworthiness. The floor sections were tested as part of a systematic research program developed to study the impact response of composite components of increasing complexity. The ultimate goal of the research program is to develop crashworthy design features for future composite aircraft. Initially, individual frames of six-foot diameter were tested both statically and dynamically. The frames were then used to

construct built-up floor sections for dynamic tests at impact velocities of approximately 20 feet/sec to simulate survivable crash velocities. In addition, static tests were conducted to gain a better understanding of the failure mechanisms seen in the dynamic tests. Author

#### DESIGNING THE NEXT GENERATION FLYING TEST BED

I. C. BELL (Pratt and Whitney Canada, Longueuil) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 16 p. refs  
(SAE PAPER 891049) Copyright

A B 720 B aircraft purchased in 1985 was modified to serve as a flying engine test bed for turboprop engines. The major structural changes to the airliner included the extension of the nose for attachment of turboprop nacelles, the addition of a winglike pylon on the port side of the forward fuselage, and modification of the number three engine pylon for structural support of a large, high bypass turbofan engine. Attention is presently given to the pitot-static systems used, which underwent several modifications in order to alleviate performance difficulties. O.C.

### A90-14361

#### INFLUENCE OF JOINT FIXITY ON THE STRUCTURAL STATIC AND DYNAMIC RESPONSE OF A JOINED-WING AIRCRAFT. I - STATIC RESPONSE

HUNG-HSI LIN, JITAI JHOU, and RONALD STEARMAN (Texas, University, Austin) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 16 p. refs  
(SAE PAPER 891060) Copyright

A comparative study is made between the internal stress resultants in a joined-wing structure that arise from employing eight different wing-joint fixities for an assumed flight loading condition. The joint fixity refers to the type of attachment that connects the rear wing tips to the forward wing tip or inboard spanwise point. The study is carried out employing both experimental as well as computational investigations. The study of the eight joint configurations indicates that the rigid joint is the most practical. This conclusion was based on a comparison as to which wing joint provided the largest reduction in the classical cantilever-wing root-bending moment. This moment reduction was subject to the constraint that no excessive joint reactions are introduced which tend to promote stiffness instabilities of the rear wing (which acts as a strut brace to the forward wing). #### FATIGUE AND ELECTROMAGNETIC INTERFERENCE TEST FOR ELECTRO-IMPULSE DE-ICING

G. W. ZUMWALT (Wichita State University, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 13 p. refs  
(SAE PAPER 891062) Copyright

Electro-Impulse De-Icing (EIDI) has been studied and developed at Wichita State University for the past six years in ten icing wind tunnel tests and three sets of flights tests. However, questions remained about the system endurance over a life-time of use and about electromagnetic compatibility. These were addressed in tests of both metal and composite leading edges. Energy levels used

were those determined necessary in the earlier tunnel and flight tests. Failures for the aluminum leading edges were found only in poorly designed coil brackets and in a pre-stressed rivet hole. No damage could be found with the composite model. Electromagnetic radiation was found to be well contained in an aluminum wing. Exposed lead wires were high power emitters and these had to be fully shielded for the composite model to meet the specifications. The emissions were broadband with no significant peak frequencies.

This paper deals with the development and application of maintenance and serviceability-related design constraints during the design of the V-22 'Osprey' multiservice aircraft. The V-22 program has been unique in its early and continuous application of supportability emphasis during the aircraft development process. Integrated teams of logistics and design engineers were formed commencing with the beginning of the preliminary design phase to ensure maximum aircraft supportability. Mockups were used extensively to develop serviceability concepts and evaluate conceptual designs. Design approaches to enhance supportability were stressed throughout the development process. This paper highlights the effectiveness of the supportability enhancement process by reviewing the process itself and describing some of its resulting effects on the design of the 'Osprey'. Because of the early and continuous emphasis on maintenance and serviceability during the V-22 design process, the V-22 'Osprey' will be the

most supportable aircraft in its weight class in the Department of Defense inventory.

##### **ENHANCED COMBAT DAMAGE TOLERANCE/SUPPORTABILITY FOR IMPROVED COMBAT SUSTAINABILITY**

ALLAN H. JOHNSON and JACK AVERY (Boeing Military Airplanes, Wichita, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 16 p.

(SAE PAPER 891078) Copyright

Future Military Aircraft will be required to maintain a higher level of combat effectiveness than their predecessors. This can be achieved by increasing threat survivability and providing rapid repair for combat damage. Achieving these goals will require full integration of survivability and supportability requirements early in the design process. This paper discusses future military airframe combat damage tolerance design requirements and features, relationship between supportability and survivability, peacetime support needs, and presents key elements of a design approach that ensures achieving combat mission effectiveness.

##### **INTERIOR NOISE CONTROL OF THE SAAB 340 AIRCRAFT**

URBAN EMBORG (Saab-Scania AB, Linkoping, Sweden) and WILLIAM G. HALVORSEN SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 13 p. refs

(SAE PAPER 891080) Copyright

A comprehensive development program was performed on the Saab 340 aircraft, with the goal of reducing sound levels at the passenger seats in the plane of the propellers. The test program included in-flight sound measurements and operating deflection shape measurements on the fuselage structure, for various propeller speeds and synchrophase angles, and structural frequency response tests. The noise control approach developed was to reduce the low-order fuselage response with the addition of viscoelastic tuned dampers to the fuselage frames in the plane of the propellers.

##### **FINITE ELEMENT CALCULATIONS OF THE INTERIOR NOISE OF THE SAAB 340 AIRCRAFT**

PETER GORANSSON (Flygtekniska Forsöksanstalten, Bromma, Sweden) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 18 p.

(SAE PAPER 891081) Copyright

The complex behavior of a fuselage-cavity system in a modern propeller aircraft has been analyzed with the finite element method. In the analysis the interaction between the fluid and the structure has been taken into account in a physical coupling formulation. The results obtained show that, at some frequencies, this coupling is very important for the vibro-acoustic system response. The eigenfrequencies and eigenmodes of the fuselage-cavity found in the analysis are compared with experimental modal analysis on a mock-up of the aircraft. The agreement is very good from 10-130 Hz. Especially the modes with strong coupling are well pronounced in the experiments.

Acoustic tests have been conducted to ascertain the noise transmission characteristics of two composite fuselage primary structure panels representative of those employed by a novel turboprop-powered aircraft; while both panels were of graphite-epoxy, one possessed honeycomb-core sandwich construction with a Nomex core, while the other was of conventional stringer-type construction. Attention is given to the details of the

## 05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE

test instrumentation as well as the most pertinent results. The honeycomb sandwich-core panel produced the lowest acoustical transmission results. O.C.

### A90-14375 EFFECT OF AN ISOLATED SHELL ON INTERIOR NOISE LEVELS IN A TURBOPROP AIRCRAFT

RAMASAMY NAVANEETHAN and ROBERT L. HOWES (Cessna Aircraft Co., Wichita, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 6 p. refs (SAE PAPER 891083) Copyright

A noise control strategy for a small twin engine turboprop aircraft is evaluated. The noise control strategy consisted of a composite shell suspended inside the aircraft on isolation mounts. The evaluation consisted of a ground test program on component panels to select the shell material and a flight test program on the aircraft with and without the interior shell installed. Results from both phases are presented. Author

### A90-14555 DYNAMIC STIFFNESS OF A HYDRAULIC DAMPER IN THE SYSTEM OF A FRONT LANDING GEAR STRUT [O DINAMICHESKOI ZHESTKOSTI GIDRAVLICHESKOGO DEMPFERA V SISTEME NOSOVOI STOIKI SHASSI]

V. A. BESPALOV, V. S. METRIKIN, and M. A. PEISEL' Aviatsonnaia Tekhnika (ISSN 0579-2975), no. 3, 1989, p. 3-6. In Russian.

Copyright

A mathematical model is developed which describes the hydraulic damper of a front landing gear strut with allowance for the support structure characteristics of the strut. The model proposed here makes it possible to evaluate the efficiency of the hydraulic damper from the damping coefficients of its support structure and links. The discussion is illustrated by specific examples. V.L.

Experiments were carried out to investigate the possibility of increasing the heat conductivity of elastic damping elements made of MR material (a porous nonwoven metal material made of metal wires) through the use of reinforcing cords made of a highly heat-conductive metal material. It is shown that the use of copper cords makes it possible to increase the heat conductivity of MR material by a factor of 10, with a 16-33-percent increase in its damping capacity. The copper reinforcement produces practically no changes in the elastic properties of the material. V.L.

The effective cross-sectional areas of the mixing exhaust ducts of a bypass engine are determined experimentally as a function of the exhaust configuration using small-scale (Re 10 to the 6th) and large-scale (Re 10 to the 7th) models. Dependences of the effective cross-sectional area on the exhaust geometry are obtained for lobe-type mixing exhausts. It is noted that the efficiency of bypass engine control with allowance for actual changes in the effective cross-sectional area is 20-30 lower than in the case of control based on changes in the geometrical area, which should be taken into account in the analysis of engine performance. V.L.

#### AEROELASTIC CHARACTERISTICS OF WINGS IN SUBSONIC FLOW

ZHENGYIN YE and LINGCHENG ZHAO (Northwestern Polytechnical University, Xian, People's Republic of China) Northwestern Polytechnical University, Journal (ISSN 1000-2758), vol. 7, Oct. 1989, p. 456-463. In Chinese, with abstract in English. refs

A numerical method is presented for predicting the static and dynamic aeroelastic characteristics of wings in subsonic flow. The method is based on the simultaneous time integration of the structural equation and dynamic fluid equation-velocity potential equation. The velocity potential equation is solved by a new, efficient aerodynamic force calculation which requires considerably less computer time than Green's function method. For any flying state, the present method can simulate the history of wing movement in the time domain. It can give not only the critical flutter speed and the subcritical and supercritical process, but also the more complicated vibration process. It can simulate the response of wings to any in-flight disturbance and can calculate the static aeroelastic characteristics directly. A rectangular wing is addressed as a computational example. C.D.

Copyright

The overriding development objectives of the A330 and A340 airliners have been the reduction of drag and weight to minimize

fuel consumption and operating costs. Taken together with other advanced technologies incorporated in these designs, these improvements represent a total savings for a fleet of 10 aircraft of \$230 million over 15 years. Emphasis has been given to increasing the content of (1) Al-Li alloys, (2) polymeric matrix composites, and (3) metal-matrix composites, while decreasing the proportion of conventional Al alloys, Ti alloys, and specialty steels. Aerodynamic drag reductions are obtained through laminar flow wing surface area maximization; a drag reduction of 10 percent is expected. O.C.

**AIRFRAME STRUCTURAL DESIGN: PRACTICAL DESIGN INFORMATION AND DATA ON AIRCRAFT STRUCTURES**

MICHAEL CHUNG-YUNG NIU (Lockheed Aeronautical Systems Co., Burbank, CA) Los Angeles/Hong Kong, Technical Book Co./Comilit Press, Ltd., 1988, 618 p. refs Copyright

The present volume constitutes a comprehensive guide to state-of-the-art practices in aircraft structural design and their embodiment in integrated CAD/CAM procedures. These practices encompass metallic primary structure materials that are fabricated either discretely, through the joining of plates and sheets, or integrally through milling, and polymer-matrix composite materials built up as laminates and either bonded or mechanically joined. Attention is given to the incorporation of mechanical, hydraulic, and electrical subsystems, the details of integral fuel tankage, fail-safe principles for pressurized cabin-forming fuselages, and the interface between wing and fuselage structures and landing gears of various configurations. Extensive inputs from the atmospheric sciences community, especially those at the Second NCAR Research Aircraft Fleet Workshop in April 1987, have identified a number of critical observational needs of research studies in global climate, atmospheric chemistry, mesoscale storm structure and dynamics, cloud physics, and stratospheric-tropospheric exchange that cannot be met with NCAR's current aircraft. The 1987 Fleet Workshop, as well as a similar workshop held earlier in 1982, resulted in strong recommendations that NCAR replace its aging Sabreliner with an advanced mid-sized jet to provide these needed capabilities. These inputs are followed up, and a plan for implementation of these recommendations is offered. Author

An inverse wing design method was developed around an existing transonic wing analysis code. The original analysis code, TAWFIVE, has as its core the numerical potential flow solver, FLO30, developed by Jameson and Caughey. Features of the analysis code include a finite-volume formulation; wing and fuselage fitted, curvilinear grid mesh; and a viscous boundary layer correction that also accounts for viscous wake thickness and curvature. The development of the inverse methods as an extension of previous methods existing for design in Cartesian coordinates is presented. Results are shown for inviscid wing design cases in super-critical flow regimes. The test cases selected also demonstrate the versatility of the design method in designing an entire wing or discontinuous sections of a wing. Author

This book provides a concise introduction to pilotless airplanes, using every-day, easy-to-understand language and clearly drawn illustrations. The structural characteristics of pilotless airplanes are discussed, and a history of their development is provided. Special emphasis is given to the problem of how control systems guide pilotless airplanes in carrying out a variety of tasks. Examples of the uses of pilotless airplanes are given, and projections are made concerning their future prospects. Topics discussed include: Take-off and recovery; Essentials of their control systems; Automatic pilot; Navigation equipment; and Telemetry and remote control; Uses and developmental trends -- As target drones; Pilotless reconnaissance planes as electronic opposition devices, warplanes, specimen collectors and observation planes, planes for scientific studies, and geological prospecting planes. ### LONG-RANGE LFC TRANSPORT

WERNER PFENNIGER *In* NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 1 p 89-115 Dec. 1987

Avail: NTIS HC A14/MF A02 CSCL 01/3

$M = 0.83$  Laminar Flow Control (LFC) transports, carrying large percentage payloads over a range of 20000 kilometers at cruise  $L/D$ 's of 39 appear feasible with large space externally braced wings, external fuel pods, active controls, and 70 percent laminar flow on wing and tail surfaces, engine nacelles and struts, and a turbulent fuselage. A combination of a swept-forward inboard and a swept-back outer wing appears superior overall, especially for laminar flow and eliminating leading edge contamination probably caused by flyspecks and ice crystals. Wing divergence appears controllable by a combination of various methods. Wind-mounted superfans with extensive laminar flow on their nacelles appear practical. Their dominant tone noise is below the frequency range of the most strongly amplified TS-waves. Author

### DEVELOPMENT FLIGHT TESTS OF JETSTAR LFC LEADING-EDGE FLIGHT TEST EXPERIMENT

DAVID F. FISHER and MICHAEL C. FISCHER (National Aeronautics and Space Administration. Langley Research Center, Hampton, VA.) *In* NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 1 p 117-140 Dec. 1987

Avail: NTIS HC A14/MF A02 CSCL 01/3

The overall objective of the flight tests on the JetStar aircraft was to demonstrate the effectiveness and reliability of laminar flow control under representative flight conditions. One specific objective was to obtain laminar flow on the JetStar leading-edge test articles for the design and off-design conditions. Another specific objective was to obtain operational experience on a Laminar Flow Control (LFC) leading-edge system in a simulated airline service. This included operational experience with cleaning requirements, the effect of clogging, possible foreign object damage, erosion, and the effects of ice particle and cloud encounters. Results are summarized. B.G.

### PERFORMANCE OF LAMINAR-FLOW LEADING-EDGE TEST ARTICLES IN CLOUD ENCOUNTERS

RICHARD E. DAVIS, DAL V. MADDALON, and RICHARD D. WAGNER *In* its Research in Natural Laminar Flow and Laminar-Flow Control, Part 1 p 163-193 Dec. 1987

Avail: NTIS HC A14/MF A02 CSCL 01/3

An extensive data bank of concurrent measurements of laminar flow (LF), particle concentration, and aircraft charging state was gathered for the first time. From this data bank, 13 flights in the simulated airline service (SAS) portion were analyzed to date. A total of 6.86 hours of data at one-second resolution were analyzed. An extensive statistical analysis, for both leading-edge test articles, shows that there is a significant effect of cloud and haze particles on the extent of laminar flow obtained. Approximately 93 percent of data points simulating LFC flight were obtained in clear air conditions; approximately 7 percent were obtained in cloud and haze. These percentages are consistent with earlier USAF and NASA estimates and results. The Hall laminar flow loss criteria was verified qualitatively. Larger particles and higher particle

concentrations have a more marked effect on LF than do small particles. A particle spectrometer of a charging patch are both acceptable as diagnostic indicators of the presence of particles detrimental to laminar flow. Author

### DESIGN AND TEST OF AN NLF WING GLOVE FOR THE VARIABLE-SWEEP TRANSITION FLIGHT EXPERIMENT

ED G. WAGGONER, RICHARD L. CAMPBELL, PAM S. PHILLIPS, and JAMES B. HALLISSY *In* its Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 753-776 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/3

Gloves for  $M = 0.7$  and  $0.8$  design points were computationally designed and analyzed at conditions over the proposed flight test envelope. The resulting computational pressure distributions were analyzed in a boundary layer stability code. These results indicate that the available pressure distributions offer a wide range of combinations of cross flow and Tollmien-Schlichting N-factors. The glove designs along with the baseline configuration were tested in an entry into the National Transonic Facility. Analysis of the force and moment data showed no significant differences in the performance and stability and control characteristics between the baseline and gloved configurations. The rolling moment constraint was met over the entire flight test envelope for the gloved configuration. Pressure distributions for the NTF test confirmed the design pressure distributions were achieved. However, it was decided that with minor modifications to the inboard region of the glove, useful available data could be significantly increased by adding another row of pressure orifices at span station 167. ### THE 757 NLF GLOVE FLIGHT TEST RESULTS

L. JIM RUNYAN, G. W. BIELAK, R. A. BEHBEHANI, A. W. CHEN,

and ROGER A. ROZENDAAL /in NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 795-818 Dec. 1987  
 Avail: NTIS HC A17/MF A03 CSCL 01/3

A major concern in the application of a laminar flow wing design to commercial transports is whether laminar flow can be sustained in the presence of the noise environment due to wing mounted turbofan engines. To investigate this issue, a flight test program was conducted using the Boeing 757 flight research airplane with a portion of the wing modified to obtain natural laminar flow. The flight test had two primary objectives. The first was to measure the noise levels on the upper and lower surface of the wing for a range of flight conditions. The second was to investigate the effect of engine noise on laminar boundary layer transition. The noise field on the wing and transition location on the glove were then measured as a function of the engine power setting at a given flight condition. The transition and noise measurement on the glove show that there is no apparent effect of engine noise on the upper surface transition location. On the lower surface, the transition location moved forward 2 to 3 percent chord. A boundary layer stability analysis to the flight data showed that cross flow disturbances were the dominant cause of transition at most flight conditions. Author

**F-14 VSTFE AND RESULTS OF THE CLEANUP FLIGHT TEST PROGRAM**

ROBERT R. MEYER, BIANCA M. TRUJILLO, and DENNIS W. BARTLETT (National Aeronautics and Space Administration, Langley Research Center, Hampton, VA.) /in NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 819-844 Dec. 1987  
 Avail: NTIS HC A17/MF A03 CSCL 01/3

Flight transition data applicable to swept wings at high subsonic speeds are needed to make valid assessments of the potential for natural laminar flow or laminar flow control for transports of various sizes at various cruise speeds. NASA initiated the variable sweep transition flight experiment (VSTFE) to help establish a boundary layer transition data base for use in laminar flow wing design. The carrier vehicle for this experiment is an F-14, which has variable sweep capability. The variable sweep outer panels of the F-14 were modified with natural laminar flow gloves to provide not only smooth surfaces but also airfoils that can produce a wide range of pressure distributions for which transition location can be determined. The VSTFE program is briefly described and some preliminary glove flight results are presented. Author

**VARIABLE-SWEEP TRANSITION FLIGHT EXPERIMENT (VSTFE): STABILITY CODE DEVELOPMENT AND CLEAN-UP GLOVE DATA ANALYSIS**

ROGER A. ROZENDAAL /in NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 845-859 Dec. 1987  
 Avail: NTIS HC A17/MF A03 CSCL 01/3

The primary objective of the Variable Sweep Transition Flight Experiment (VSTFE) was to establish an improved swept wing transition criterion. The development of the Unified Stability System gave a way of quickly examining disturbance growth for a wide variety of laminar boundary layers. The disturbance growth traces shown are too scattered to define a transition criteria to replace the F-111 data band, which has been used successfully to design NLF gloves. Still, a careful review of the clean-up glove data may yield cases for which the transition location is known more accurately. Liquid crystal photographs of the clean-up glove show much spanwise variation in the transition front for some conditions, and this further complicates the analyses. Several high quality cases are needed in which the transition front is well defined and at a relatively constant chordwise station. Author

**STATUS REPORT ON A NATURAL LAMINAR-FLOW NACELLE FLIGHT EXPERIMENT Abstract Only**

EARL C. HASTINGS, JR., G. K. FAUST, PARMA MUNGUR, CLIFFORD J. OBARA, S. S. DODBELE, JAMES A. SCHOENSTER, and MICHAEL G. JONES (PRC Kentron, Inc., Hampton, VA.) /in *its* Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 887-890 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 01/3

The natural laminar flow (NLF) nacelle experiment is part of a drag reduction production program, and has the dual objectives of studying the extent of NLF on full scale nacelles in a flight environment and the effect of acoustic disturbance on the location of transition on the nacelle surface. The experiment is being conducted in two phases: (1) an NLF fairing was flown on a full scale Citation nacelle to develop the experiment technique and establish feasibility; (2) full scale, flow through, NLF nacelles located below the right wing of an experimental NASA OV-1 aircraft are evaluated. The measurements of most interest are the static pressure distribution and transition location on the nacelle surface, and the fluctuating pressure levels associated with the noise sources. Data are collected in combinations of acoustic frequencies and sound pressure levels. The results of phase 2 tests to date indicate that on shape GE2, natural laminar flow was maintained as far aft as the afterbody joint at 50 percent of the nacelle length. An aft facing step at this joint caused premature transition at this station. No change was observed in the transition pattern when the noise sources were operated. Author

**NACELLE DESIGN**

G. K. FAUST and PARMA MUNGUR /in NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 891-907 Dec. 1987  
 Avail: NTIS HC A17/MF A03 CSCL 01/3

The external cowlings of engine nacelles on large turbofan powered aircraft are good candidates for application of natural laminar flow. These nacelles usually have shorter characteristic lengths than other candidate surfaces such as wings and fuselages and therefore have lower characteristic Reynolds numbers. A conceptive figure of the natural flow nacelle (NLF) is shown. On the typical nacelle the flow accelerates to a curvature induced velocity peak near the lip and then decelerates over the remainder of the nacelle length. Transition occurs near the start of the deceleration, so turbulent flow with high friction coefficient exists over most of the nacelle length. On the other hand, the NLF nacelle is contoured to have an accelerating flow over most of its length, so transition is delayed, and a relatively lower friction drag exists over most of the nacelle. The motivation for development of the LFN is a potential 40 to 50 percent reduction in nacelle friction drag. Author

**NACELLE AERODYNAMIC PERFORMANCE**

CLIFFORD J. OBARA and S. S. DODBELE (Vigyan Research Associates, Inc., Hampton, VA.) /in NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 908-913 Dec. 1987  
 Avail: NTIS HC A17/MF A03 CSCL 01/3

The boundary layer transition location was measured on a nacelle shape using the sublimating chemical flow visualization technique. This technique involves coating the surface with a thin film of volatile chemical solid, which, during exposure to a free stream airflow, rapidly sublimates in the turbulent boundary layer as a result of high shear stress and high mass transfer near the surface. Transition is indicated because the chemical coating remains relatively unaffected in the laminar region due to lower shear and low mass transfer. The slow response time of the chemical in a laminar boundary allowed for two test conditions during the same flight. The aircraft was first flown at the desired airspeed and altitude with the noise source off. Once a pattern had developed, the noise source was turned on to the desired

## 05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE

setting and a new chemical pattern was sought. In this fashion a direct comparison of the effect of the noise could be determined.

### **INTEGRATED MULTIDISCIPLINARY OPTIMIZATION OF ROTORCRAFT: A PLAN FOR DEVELOPMENT**

HOWARD M. ADELMAN, ed. and WAYNE R. MANTAY, ed. May 1989 83 p

(NASA-TM-101617; NAS 1.15:101617; AVSCOM-TM-89-B-004)

Avail: NTIS HC A05/MF A01 CSCL 01/3

This paper describes a joint NASA/Army initiative at the Langley Research Center to develop optimization procedures aimed at improving the rotor blade design process by integrating appropriate disciplines and accounting for important interactions among the disciplines. The paper describes the optimization formulation in terms of the objective function, design variables, and constraints. Additionally, some of the analysis aspects are discussed, validation strategies are described, and an initial attempt at defining the interdisciplinary couplings is summarized. At this writing, significant progress has been made, principally in the areas of single discipline optimization. Accomplishments are described in areas of rotor aerodynamic performance optimization for minimum hover horsepower, rotor dynamic optimization for vibration reduction, and rotor structural optimization for minimum weight.

### **GENERAL APPROACH AND SCOPE**

HOWARD M. ADELMAN and WAYNE R. MANTAY (Army Aviation Systems Command, Hampton, VA.) *In its Integrated Multidisciplinary Optimization of Rotorcraft: A Plan for Development* p 3-10 May 1989

Avail: NTIS HC A05/MF A01 CSCL 01/3

This paper describes a joint activity involving NASA and Army researchers at the NASA Langley Research Center to develop optimization procedures aimed at improving the rotor blade design process by integrating appropriate disciplines and accounting for all of the important interactions among the disciplines. The disciplines involved include rotor aerodynamics, rotor dynamics, rotor structures, airframe dynamics, and acoustics. The work is focused on combining these five key disciplines in an optimization procedure capable of designing a rotor system to satisfy multidisciplinary design requirements. Fundamental to the plan is a three-phased approach. In phase 1, the disciplines of blade dynamics, blade aerodynamics, and blade structure will be closely coupled, while acoustics and airframe dynamics will be decoupled and be accounted for as effective constraints on the design for the first three disciplines. In phase 2, acoustics is to be integrated with the first three disciplines. Finally, in phase 3, airframe dynamics will be fully integrated with the other four disciplines. This paper deals with details of the phase 1 approach and includes details of the optimization formulation, design variables, constraints, and objective function, as well as details of discipline interactions, analysis methods, and methods for validating the procedure.

Avail: NTIS HC A05/MF A01 CSCL 01/3

The rotor dynamic design considerations are essentially limitations on the vibratory response of the blades which in turn limit the dynamic excitation of the fuselage by forces and moments transmitted to the hub. Quantities which are associated with the blade response and which are subject to design constraints are discussed. These include blade frequencies, vertical and inplane hub shear, rolling and pitching moments, and aeroelastic stability margin.

### **ACOUSTIC DESIGN CONSIDERATIONS: REVIEW OF ROTOR ACOUSTIC SOURCES**

RUTH M. MARTIN *In its Integrated Multidisciplinary Optimization of Rotorcraft: A Plan for Development* p 22-27 May 1989

Avail: NTIS HC A05/MF A01 CSCL 01/3

It is not sufficient to optimize a rotor design in terms of a single noise level calculated for a single flight condition and a single measurement location. The various noise sources, their frequency content, amplitude, and directivity as a function of operating condition must be considered. A summary of the frequency ranges, directivity patterns and the most important operational and design parameters for major rotor noise sources is presented. It is difficult to generalize design requirements for rotor noise because the acoustic output varies so widely depending on the noise source, flight condition, measurement location, and frequency range. However, assuming the rotor must lift a fixed nominal payload and operate over a wide range of flight conditions, three general design guidelines can be stated: (1) minimize tip Mach number; (2) minimize blade thickness in the tip region; and (3) minimize gradients in the spanwise lift distribution in the tip region. Constraints on blade thickness, maximum values for hover tip Mach number, advancing tip Mach number and spanwise lift coefficient gradient will be specified during the aerodynamic, dynamic and structural optimization process. The rotor noise sources to be considered include the low frequency loading and thickness noise, and the higher frequency noise due to blade-vortex interactions (BVI). The analyses to be employed will include the comprehensive rotor analysis and design program CAMRAD and the rotor noise prediction program WOPWOP.

Powered lift aircraft have the ability to vary the magnitude and direction of the force produced by the propulsion system so as to control the overall lift and streamwise force components of the aircraft, with the objective of enabling the aircraft to operate from minimum sized terminal sites. Power lift technology has contributed to the development of the jet lift Harrier and to the forth coming operational V-22 Tilt Rotor and the C-17 military transport. This technology will soon be expanded to include supersonic fighters with short takeoff and vertical landing capability, and will continue to be used for the development of short- and vertical-takeoff and landing transport. An overview of this field of aeronautical technology is provided for several types of powered lift aircraft. It focuses on the description of various powered lift concepts and their operational capability. Aspects of aerodynamics and flight controls pertinent to powered lift are also discussed.

**WHAT SHOULD BE DONE WITH THOSE NOISY OLD AIRCRAFT**

M. J. T. SMITH and V. M. SZEWCZYK 2 Sep. 1988 10 p Presented at the AVMARK International Ltd. Conference of European Aircraft Noise Legislation: Consequences for the Aviation Industry, London, England, 2 Sep. 1988

(PNR90562; ETN-89-95549) Copyright Avail: NTIS HC A02/MF A01

The problem of adapting older noisy aircraft to more stringent noise legislation is discussed. The use of bolt-on hushkits as a means of quieting older aircraft is criticized. Further noise restrictions demand a truly re-engined aircraft. It is predicted that hushkit equipped planes will experience increasing difficulty when operating in noise sensitive airports. The author admits that Rolls Royce has a commercial interest in recommending that older planes be re-engined with stage three turbo fan engines.

##### HOLOGRAPHIC HEAD-UP DISPLAYS FOR AIR AND GROUND APPLICATIONS

PHILIP J. ROGERS (Pilkington P. E., Ltd., Saint Asaph, Wales) IN: Optical design methods, applications, and large optics; Proceedings of the Meeting, Hamburg, Federal Republic of Germany, Sept. 19-21, 1988. Bellingham, WA, Society of Photo-Optical Instrumentation Engineers, 1989, p. 136-145. refs Copyright

The operating principles and practical feasibility of holographic optical combiners for use in aircraft or automobile head-up displays (HUDs) are discussed and illustrated with drawings and diagrams. The limitations of conventional HUDs based on partially reflecting passive combiners are contrasted with the advantages of the projected-porthole or pupil-relay HUD; the construction of a phase-hologram combiner on dichromated gelatin is described; and the effect of the holographic fringes on an incident light beam is explained. Particular attention is given to techniques for alleviating asymmetric aberration in holographic HUDs, the angular bandwidths of holographic combiners, quasi-axial and off-axis holographic HUDs, and the problems of creating reliable, low-cost, lower-performance holographic HUDs (generally not requiring collimation or outside-view transmission) for automobiles. T.K.

##### GPS HOVER POSITION SENSING SYSTEM

P. OKUNIEFF, J. D. ANTONIS, J. GREEN, R. HOGABOOM, P. SLONAKER (Intermetrics, Inc., Cambridge, MA) et al. IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 187-191. (Contract DAAB07-87-D-H020)

The feasibility of a GPS Hover Position Sensing System, capable of providing relative horizontal position accuracy to within one meter for three minutes during a hover mission, was investigated. A unique approach to both the real-time data collection and the navigation processing combined with a navigation sensor suite consisting of a GPS receiver and an ASN-141 Inertial Navigation System permits this stringent relative position requirement to be met. Real-time data recording involved software and hardware design and development methods for collecting and time-synchronizing GPS and INS raw measurements, and 'true' hover position information. The validity of the processing algorithms was evaluated using Monte Carlo simulation techniques and actual flight data. The results show that 1.3-meter accuracy is achievable with GPS in spite of large HDOPs and no ionospheric correction data. Author

##### ARCHITECTURE OPTIONS FOR GPS/CAROUSEL IV INTEGRATION

BARRY E. GRIFFITHS (Integrity Systems, Inc., Lexington, MA), SAMUEL K. GEORGE (USAF, Oklahoma City Air Logistics Center,

OK), JAY S. COOPER, and ROBERT G. MCCARRON (Analytic Sciences Corp., Dracut, MA) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 309-317. refs (Contract F34601-87-C-1655)

The U.S. Air Force wishes to integrate the GPS Phase III receiver with the existing navigation systems of a number of aircraft. The USAF inventory includes about 3000 physically identical Carousel IV-E inertial navigation equipments, suggesting that a common integration satisfying the requirements of all Carousel IV-E users could significantly reduce development and logistics costs below that which would be expected for individual GPS integrations. This paper presents interim results of an effort to define such an integration architecture. C.D.

#### A90-14012#

##### THE ACCURACY OF BAROMETRIC ALTIMETERS WITH RESPECT TO GEOMETRIC ALTITUDE

JOHN DOBYNE (ARINC Research Corp., San Diego, CA) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 451-459. refs

This paper presents estimates of the accuracy of barometric altimeters with respect to the geometric altitude above mean sea level. The primary source of altimeter error is found to be the conversion from atmospheric pressure to altitude. The ability of the altimeter to measure air pressure and perform the conversion is quite good in comparison. Global extremes of altimeter error due to variations of atmospheric pressure and worst-case error gradients with vertical and horizontal motion were investigated. The effectiveness of compensation for local surface pressure and ambient air temperature and to estimate the magnitude of the altimeter system error was determined. It is concluded that barometric altimeters should not be used for geometric altitude measurements. C.D.

#### A90-14354

##### DESIGN PHILOSOPHY FOR A GENERAL AVIATION TCAS DISPLAY

RICHARD L. NEWMAN and PATRICK BRANS (Avion Systems, Inc., Leesburg, VA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 15 p. refs (SAE PAPER 891052) Copyright

Basic human factors principles have been adhered to in the design of a Traffic Advisory and Collision Avoidance System (TCAS) display for single-pilot (general aviation) operation. While the system is of stand-alone type, it is compatible with such other cockpit displays as navigation and weather depiction radar screens. The TCAS control panel has been sized for typical general aviation radio racks. The TCAS modes encompass the normal, the declutter mode, and the select mode for specific targets designated by the pilot by means either of a cursor or the entering of that target's transponder code. O.C.

#### A90-14356

##### TWO EFFECTIVE METHODS OF APPROACH AND LANDING BY VISUAL DISPLAY

RENZO YOKOI and KAZUO MATSUBARA (Nihon University, Tokyo, Japan) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 9 p. refs (SAE PAPER 891054) Copyright

An evaluation is made of the effectiveness of two cockpit visual displays that address the need to improve pilot situational awareness during runway approach and landing operations. The first system considered furnishes a simulated airport runway lighting scheme comparable to night-lighting for visual approaches; the image is projected onto the windscreen by a HUD in all weather conditions. The second system displays the reflector-marked runway contour on the airborne weather radar scope. Both systems are judged to be very effective in facilitating pilot recognition of approach paths. O.C.

## DESIGN AND DEVELOPMENT OF THE GARRETT F109 TURBOFAN ENGINE

HANS F. MAERTINS, JAY D. BATSON, MARK A. STEELE (Allied-Signal Aerospace Co., Garrett Engine Div., Phoenix, AZ), and KENNETH W. KRIEGER (Allied-Signal Aerospace Co., Garrett Auxiliary Power Div., Phoenix, AZ) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 12 p.

(SAE PAPER 891046) Copyright

The F109-GA-100 engine, flat rated at 1330-pounds thrust at sea level static maximum power conditions, was developed to address the United States Air Force need for a new primary trainer. As such, it required very low fuel consumption, high reliability, and ease of operation. This paper describes the development program and highlights the Engine Structural Integrity Program (ENSIP) approach to the design and the Accelerated Mission Test (AMT) approach to testing, both of which are new approaches to engine development. Solutions to problems encountered are discussed, and a summary of flight test experience is included. Author

### A90-14351

## GARRETT TPF351-20 TURBOPROP FAN ENGINE DEVELOPMENT

R. D. MILLER (Allied-Signal Aerospace Co., Garrett Engine Div., Phoenix, AZ) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 10 p.

(SAE PAPER 891047) Copyright

The design methodology applied to the TPF351-20/20 2000 shp-class, free turbine-powered gearbox turbopropfan engine's configuration has attempted to meet market demands defined by 19-30 passenger regional airliners by applying advanced materials to proven component designs. The design thus obtained achieves the maximum degree of commonality between pusher and tractor engine installations, as well as a high degree of growth capability to ensure continuing applicability in future years to additional regional airliner designs. The pusher configuration is especially

## 07 AIRCRAFT PROPULSION AND POWER

attractive, in virtue of the cabin noise reductions associated with a near-stern propeller plane aft of the cabin. O.C.

### A90-14352

#### **SUCCESSFUL PERFORMANCE DEVELOPMENT PROGRAM FOR THE T800-LHT-800 TURBOSHAFT ENGINE**

ANDREW A. COSNER and GLYN S. RUTLEDGE (Light Helicopter Turbine Engine Co., Saint Louis, MO) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 13 p.

(SAE PAPER 891048) Copyright

The engine performance development program for the 1200-shp class T800-LHT-800 helicopter powerplant for the U.S. Army's next-generation LHX helicopter began by methodically diagnosing a test engine whose part-power specific fuel consumption deviated from design levels by about 6 percent. On the basis of this effort's findings, configuration changes that could be economically incorporated into production engines were developed; these were found to yield a performance improvement which lay significantly beyond specification requirements. An account is given of valuable lessons from this development program. O.C.

#### **THE VARIABLE CYCLE DIESEL AS AN AIRCRAFT ENGINE**

RICHARD P. JOHNSTON SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 8 p.

(SAE PAPER 891065) Copyright

A brief summary of previous significant aircraft diesel engine development and application is presented along with a comparison with the then contemporary state-of-the-art aircraft gasoline engine. Performance results for an Advanced Variable Cycle Diesel (AVCD) engine obtained from a computer simulator code are presented and comparisons made with an identical fixed cycle engine. Some operational benefits of an AVCD engine are discussed along with an alternate method of controlling the engine's precompression turbocompressor. Finally, the altitude capability of an AVCD engine is shown and a description of a 750 SHP AVCD aircraft engine suitable for use on a medium size subsonic business transport plane is presented along with its projected performance. #### **SIMULATION OF A TURBOCOMPOUND TWO-STROKE DIESEL ENGINE**

J. A. HARRIS and A. M. YOUSSEF (Wichita State University, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 10 p. Research supported by the U.S. Army. refs

(SAE PAPER 891066) Copyright

A FORTRAN computer code has been developed to simulate the performance of a turbocompound two-stroke diesel engine. This powerplant offers the potential for fuel efficiency combined with high power-to-weight ratio, and is being considered for airborne applications such as helicopters and drone aircraft. The simulation code allows the user to specify engine parameters for the diesel core, the turbocharger (in the form of a performance curve), the bottoming turbine, and the intercooler. The program runs in two modes. The user runs the design mode first, in which specification parameters are set and the code sizes the turbomachinery and intercooler. The off-design mode can then be run to see how the resulting engine will perform at off-design values of ambient conditions, fueling rate, and engine speed. Author

The paper is concerned with the problem of selecting the optimal

number, conditions, and duration of accelerated equivalent tests for aircraft gas turbine engines designed for use on a variety of aircraft operating in different climatic regions. An approach to the selection of the optimal program of accelerated testing is proposed which makes it possible to obtain a guaranteed estimate of the reliability and service life of the engine for each of all the possible applications. The method proposed here is illustrated by a specific example. V.L.

R. A. KIRZHNER and B. I. MAMAEV Aviaionnaia Tekhnika (ISSN 0579-2975), no. 3, 1989, p. 52-56. In Russian.

Copyright

The factors affecting the minimal permissible radial clearance in a gas turbine, which is sufficient to prevent the dangerous contact between the rotor and the casing, are examined. It is shown that the radial clearance changes with the operating conditions and may be relatively large if special efforts are not made to reduce it. Methods of reducing the permissible radial clearance are discussed. V.L.

#### **ESTIMATION OF THE TECHNICAL RISK CRITERION IN SELECTING THE OPERATING PARAMETERS OF AIRCRAFT GAS TURBINE ENGINES [OTSENKA KRITERIIA TEKHNIЧЕСКОГО РИСКА ПРИ ВЫБОРЕ ПАРАМЕТРОВ РАБОЧЕГО ПРОЦЕССА АВИАЦИОННОГО GTD]**

A. N. KOVARTSEV Aviaionnaia Tekhnika (ISSN 0579-2975), no. 3, 1989, p. 56-59. In Russian.

Copyright

The use of a criterion based on the concept of technical risk as a measure of the reliability of gas turbine designs is discussed. An analysis of the technical risk criterion indicates that the initial data distribution law does not have a significant effect on the values of the design parameters minimizing the technical risk. The technical risk is largely determined by the selected design strategy involving the selection of parameters defined in the technical specification and the assignment of limiting values to these parameters. V.L.

### EFFECT OF THE RADIAL CLEARANCE ON THE EFFICIENCY OF A PARTIAL MICROTURBINE [VLIANIE RADIAL'NOGO ZAZORA NA EFFEKTIVNOST' PARTSIAL'NOI MIKROTURBINY]

B. A. KRYLOV and S. A. GUSAROV Aviatsonnaia Tekhnika (ISSN 0579-2975), no. 3, 1989, p. 96-98. In Russian.  
Copyright

Results of an experimental study of the effect of the radial clearance on the efficiency of partial microturbines with a shroudless rotor are reported. With reference to results obtained for radial clearances of 0.1, 0.3, 0.5, and 1.0 mm and axial clearances of 0.1 and 1.0 mm, it is shown that the effect of the radial clearance on the turbine efficiency significantly increases with the decreasing partial admission ratio and increasing axial clearance. An analysis of the results obtained indicates that high-efficiency partial microturbines can be designed provided that the radial and axial clearances are sufficiently small. V.L.

### OPERATION OF A COMPRESSOR WITH INTERMEDIATE AIR BLEED [RABOTA KOMPRESSORA S PROMEZHUOTCHNYM PEREPUSKOM VOZDUKHA]

E. D. STEN'KIN Aviatsonnaia Tekhnika (ISSN 0579-2975), no. 3, 1989, p. 103, 104. In Russian.  
Copyright

In the case of compressor operation under off-design conditions, with rpm lower than normal, the first stages are loaded while the last stages are unloaded. In order to reduce the range of angle of attack change, controlled air bleed is introduced after the middle stages, which increases the efficiency of the stages and reduces the power required for the engine start-up. Here, the characteristics of compressor operation with intermediate air bleed are investigated analytically, with particular attention given to the relationship between the shift of the head lines on the compressor characteristic and the amount of air bleed. V.L.

### EFFECT OF THE ANGLE OF ATTACK ON THE EFFICIENCY AND THRUST RATIO OF AXIAL-FLOW MICROTURBINES WITH FULL ADMISSION [VLIANIE UGLA ATAKI NA EKONOMICHNOST' I STEPEN' REAKTIVNOSTI OSEVYKH MIKROTURBIN S POLNYM VPUSKOM]

N. T. TIKHONOV and E. E. PFAIFLE Aviatsonnaia Tekhnika (ISSN 0579-2975), no. 3, 1989, p. 104-106. In Russian.  
Copyright

The effect of the angle of attack on the efficiency and thrust ratio of axial-flow microturbines was investigated experimentally for angles of attack varying from -16 to +13 deg using eight

different rotors. It is shown that there exists an optimal range of angles of attack for each value of  $Y_t = u/c_1s$ . Thus, for  $Y_t = 0.3$ , this range is from -4 to +2 deg. An increase in the angle of attack by 2 deg (i.e., to +4 deg) leads to a 6.8-percent decrease in efficiency; a decrease by 2 deg from the optimal range (i.e., to -6 deg) leads to a 3.5-percent decrease in efficiency. As  $Y_t$  decreases, the effect of the angle of attack on efficiency becomes less pronounced and remains constant for  $Y_t = 0.1$ . V.L.

### EXHAUST EMISSION PERFORMANCE OF A VAPORIZER TUBE COMBUSTOR AS COMPARED WITH A SINGLE TUBE COMBUSTOR

HUIYING LI, LING LIU, MING TANG, HONGJI WANG, ERPING WU (Northwestern Polytechnical University, Xian, People's Republic of China) et al. Northwestern Polytechnical University, Journal (ISSN 1000-2758), vol. 7, Oct. 1989, p. 447-455. In Chinese, with abstract in English. refs

The control of exhaust emissions is an important problem in the design and development of modern gas turbine combustors. The exhaust emissions of a vaporizer tube combustor and a single tube combustor were measured using a combustion test setup, and the results show that the former is much better than the latter. There is no exponential increase of  $NO(x)$  with increasing  $T3$ -asterisk, and the increase of  $NO(x)$  slows down with increasing  $T3$ -asterisk.  $NO(x)$  emissions in the vaporizer tube combustor increases more slowly than those in the single tube combustor when inlet air temperature  $T2$ -asterisk and pressure  $P2$ -asterisk rise. There is an average increase of 10 percent in  $NO(x)$  emission when  $G_a$  is reduced by 40 percent, and in the single tube combustor a large increase in  $NO(x)$  occurs when  $G_a$  is reduced. C.D.

### LARGE-EDDY SIMULATIONS OF PRESSURE OSCILLATIONS AND COMBUSTION INSTABILITY IN A RAMJET

WEN-HUEI JOU (Boeing Co., Seattle, WA) and SURESH MENON (Flow Research, Inc., Kent, WA) IN: Heat Transfer and Fluid Mechanics Institute, 31st, Sacramento, CA, June 1, 2, 1989, Proceedings. Sacramento, CA, California State University, 1989, p. 1-14. refs

(Contract N00019-88-C-0290)

Copyright

An evaluation is made of the development status of the large-eddy simulation (LES) technique's applications to unsteady flows in ramjet combustors. The primary current limitation of LES is the lack of three-dimensional dynamics; at present, only axisymmetric flows are considered. In addition, the inlet diffuser shock is not included in the existing model, and the inflow boundary conditions do not correspond to any plausible acoustic shock impedance. Finally, the modeling of subgrid-scale turbulence is thus far rather limited. O.C.

### AN INVESTIGATION INTO THE INTERNAL HEAT TRANSFER CHARACTERISTICS OF A THERMALLY ANTI-ICED AERO-ENGINE INTAKE LIPSKIN

S. J. RILEY (Rolls-Royce, PLC, Derby, England) and E. H. JAMES

(Loughborough University of Technology, England) IN: Heat Transfer and Fluid Mechanics Institute, 31st, Sacramento, CA, June 1, 2, 1989, Proceedings. Sacramento, CA, California State University, 1989, p. 59-76. refs  
Copyright

Thermal anti-icing systems are commonly used to prevent potentially hazardous ice accretion on aircraft leading edges. To optimize such a system requires accurate modeling techniques, and to improve existing methods, investigations have been made into the heat transfer characteristics of a typical aero-engine intake fitted with a jet impingement hot air anti-icing system. As part of this research, a series of tests was carried out in a sea level wind tunnel using an instrumented full-scale model intake section to provide data for the re-definition of internal heat transfer characteristics. An expression for the internal heat transfer is derived. Author

### A90-16001# APPLIED TECHNOLOGY IN GAS TURBINE AIRCRAFT ENGINE DEVELOPMENT

THOMAS C. PAUL (GE Aircraft Engines, Lynn, MA) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 333-340.

Current development efforts at GE Aircraft Engines are reviewed, including: (1) large structural castings to simplify components, (2) polymeric composites for light weight and strength, (3) improved methods for determining heat transfer, and (4) coatings and surface treatments to prolong component life. Particular attention is given to the implementation of these technologies in the T700 and F404 engines. B.J.

### A90-16002# XG40 - ROLLS-ROYCE ADVANCED FIGHTER ENGINE DEMONSTRATOR

G. M. LEWIS (Rolls-Royce, PLC, Bristol, England) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 341-352. Research supported by Ministry of Defence Procurement Executive.

Commenced in 1982, the XG40 program is central to the demonstration of Rolls-Royce technology appropriate to the requirements of the advanced combat engine for mid 1990's operation. At the same time, the technology in scaled form is viewed as having wider application than for the advanced combat engine alone. To meet the multi-role requirements of advanced twin and single-engined fighters, the combat engine must be designed to give enhanced dry thrust, retain good dry specific fuel consumption and reduce reheated fuel consumption compared with current fighter engines. A thrust/weight ratio of 10 : 1 is targeted and at the same time requirements for operating cost, reliability and durability are stringent. Advanced materials, manufacturing technology and design of structures have been incorporated to enable the required levels of reliability, durability, component cost and weight to be demonstrated. The engine is in the 90/95 kN nominal Sea Level Static Combat thrust class.

### A90-16004# ADVANCED COMBUSTOR LINER COOLING TECHNOLOGY FOR GAS TURBINES

ASPI R. WADIA (General Electric Co., Cincinnati, OH) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 363-380. refs

This paper briefly reviews some of the work on advanced liner cooling techniques - specifically laminated porous wall cooling, angled-multihole (effusion) cooling and composite metal matrix liner cooling. The concept definition, heat transfer design procedure and design problems including key materials and fabrication considerations associated with each basic concept will be reviewed. Published rig and engine experience of aircraft engine manufacturers and research organizations will be cited. Some logical extensions of the current liner cooling schemes are suggested for future applications. Author

### A90-16005# SELECTION OF A SUITABLE COMBUSTION SYSTEM FOR A SMALL GAS TURBINE ENGINE

P. ARUNACHALAM (Hindustan Aeronautics, Ltd., Bangalore, India) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 381-395. refs

Experimental studies on a straight and a reverse flow annular combustion chamber to select a suitable combustion system for a small gas turbine engine are presented. One straight flow annular combustor with simplex fuel injector and three sector models of the reverse flow annular combustor with simplex, airblast and vaporizer type of fuel injectors were fabricated and tested, retaining the same maximum outer casing diameter. The paper presents the basic design procedure, the three types of fuel injection system and the performance comparison of these models. An attempt has been made to develop a correlation to compare the performance of the models. It has been concluded that with the available data, for small gas turbine engines, reverse flow annular combustor with vaporizer is the best from overall considerations.

### A90-16006# GAS TURBINE ENGINE COMPONENT DEVELOPMENT - AN INTEGRATED APPROACH

WILLEM JANSEN (Northern Research and Engineering Corp., Woburn, MA) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 397-411. refs

Computer-aided engineering methods have made a significant impact in the design technologies of advanced machinery. These methods have been applied in several areas such as aerodynamic and fluid dynamic theory for high efficiency, stress and vibration theory for reliability and manufacturing strategies to produce machined components at low cost and with short time schedules. The integration of these various design technologies offer the opportunity for even greater productivity in the engineering design and manufacturing process. This paper addresses the application of various engineering disciplines to the demand of producing a reliable, efficient design and the subsequent manufacture of components with short lead times through the interaction of these computer-aided engineering technologies. The concept is further illustrated by sample cases for a centrifugal compressor and a gas turbine. Author

### A90-16007# DESIGNING TURBINE BLADES FOR FATIGUE AND CREEP BRUNO DAMBRINE and JEAN PIERRE MASCARELL (SNECMA, Paris, France) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 413-429. refs

Various methods and tools adopted at SNECMA for modeling the thermal fatigue and creep phenomena of turbine blades are described. A novel life prediction method is described and analyses are presented of the constitutive equations of the material for modeling the viscoelastic effects under cyclic loading; the structure of a finite element program used to simulate cyclic viscoplastic behavior; and the continuum damage method. The proposed theoretical approach has been validated experimentally. Finally, the exploitation of single crystal alloys is considered. B.J.

### A90-16008# PHOTOELASTIC INVESTIGATION OF TURBINE ROTOR BLADE SHROUDS

U. CHANDRASEKHAR, D. GURURAJ, K. RAMACHANDRA, and R. PADMANABHAN (Gas Turbine Research Establishment, Bangalore, India) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 431-438.

This paper deals with the photoelastic stress analysis carried out to investigate the premature failure of low pressure turbine rotor blade shrouds of an experimental gas turbine. Stress distribution at the shroud aerofoil interface was studied for the original rectangular shroud geometry by stress-freezing the photoelastic model blades under rotating conditions. The combined influence of taper shroud geometry and larger fillet radius in mitigating the shroud stress is studied by the three-dimensional

photoelastic technique and an optimized shroud geometry subject to the stress requirements of blade material is suggested.

##### SQUEEZE FILM DAMPING FOR AIRCRAFT GAS TURBINES

R. W. SHENDE and S. K. SANE (Indian Institute of Technology, Bombay, India) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 439-456. refs

Modern aircraft gas turbine engines depend heavily on squeeze film damper supports at the bearings for abatement of vibrations caused by a number of probable excitation sources. This design ultimately results in light-weight construction together with higher efficiency and reliability of engines. Many investigations have been reported during past two decades concerning the functioning of the squeeze film damper, which is simple in construction yet complex in behavior with its nonlinearity and multiplicity of variables. These are reviewed in this article to throw light on the considerations involved in the design of rotor-bearing-casing systems incorporating squeeze film dampers.

##### INTEGRATED APPROACH TO DESIGN AND MANUFACTURE OF GAS TURBINE COMPONENTS BASED ON GROUP THEORY

M. JAWAHARLAL and A. ARUL RAJ (Gas Turbine Research Establishment, Bangalore, India) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 457-465. refs

This paper deals with a new method that provides an integrated approach to design and manufacture of gas turbine components by using the group theory and customizing standard computer-aided design and manufacturing system. With this approach, time-consuming and iterative design procedure and process-planning are automated and become more efficient. Due to the intricate and diverse nature of gas turbine components, grouping them is not easy as in other industries. A possible way of grouping the gas turbine components based on design and manufacturing attributes on a broad basis is presented. A case study of high pressure turbine disk is included with illustrations for design and process-planning of this component. The proposed system is implemented on a personal computer and offers an alternate solution to sophisticated and expensive mainframe-based system.

##### EFFECTS OF A HEAT CYCLE ON MATERIAL STRENGTH

TAMEHARU IKEDA Jan. 1987 14 p In JAPANESE (NAL-TM-562; ISSN-0452-2982; JTN-88-80057) Avail: NTIS HC A03/MF A01

Pyrogenic components of thermal engines that are frequently started and stopped, such as in aircraft jet engines, are repetitively subjected to heating and cooling due to engine starts and stops. Therefore, the non-steady thermal stresses that result must be taken into consideration. These thermal stress are caused by many compounded conditions such as changes in heating and cooling speeds, heat transfer, thermal conduction, thermal expansion, specific heat and the shapes of parts and members. Heating and cooling tests of T3 treated sheets of high-tension aluminum alloy 2024S and cast iron are discussed. The cast iron test was conducted by repeated heating and cooling to study cracking and propagation of high-temperature parts and materials. The tests were conducted in a wind tunnel for thermal shock tests.

##### PROPFAN TEST ASSESSMENT (PTA): FLIGHT TEST REPORT

B. H. LITTLE, H. W. BARTEL, N. N. REDDY, G. SWIFT, C. C. WITHERS, and P. C. BROWN (United Technologies Corp., Windsor Locks, CT.) Apr. 1989 276 p

(Contract NAS3-24339)

(NASA-CR-182278; NAS 1.26:182278; LG89ER0026) Avail: NTIS HC A13/MF A02 CSCL 21/5

The Propfan Test Assessment (PTA) aircraft was flown to obtain glade stress and noise data for a 2.74m (9 ft.) diameter single rotation propfan. Tests were performed at Mach numbers to 0.85 and altitudes to 12,192m (40,000 ft.). The propfan was well-behaved structurally over the entire flight envelope, demonstrating that the blade design technology was completely adequate. Noise data were characterized by strong signals at blade passage frequency and up to 10 harmonics. Cabin noise was not so high as to preclude attainment of comfortable levels with suitable wall treatment. Community noise was not excessive.

##### PROPFAN TEST ASSESSMENT (PTA) Final Report

B. H. LITTLE, D. T. POLAND, H. W. BARTEL, C. C. WITHERS, and P. C. BROWN (United Technologies Corp., Windsor Locks, CT.) Jul. 1989 676 p

(Contract NAS3-24339)

(NASA-CR-185138; NAS 1.26:185138; LG89ER0064) Avail: NTIS HC A99/MF A04 CSCL 21/5

The objectives of the Propfan Test Assessment (PTA) Program were to validate in flight the structural integrity of large-scale propfan blades and to measure noise characteristics of the propfan in both near and far fields. All program objectives were met or exceeded, on schedule and under budget. A Gulfstream Aerospace Corporation GII aircraft was modified to provide a testbed for the 2.74m (9 ft) diameter Hamilton Standard SR-7 propfan which was driven by a 4475 kw (600 shp) turboshaft engine mounted on the left-hand wing of the aircraft. Flight research tests were performed for 20 combinations of speed and altitude within a flight envelope that extended to Mach numbers of 0.85 and altitudes of 12,192m (40,000 ft). Propfan blade stress, near-field noise on aircraft surfaces, and cabin noise were recorded. Primary variables were propfan power and tip speed, and the nacelle tilt angle. Extensive low altitude far-field noise tests were made to measure flyover and sideline noise and the lateral attenuation of noise. In cooperation with the FAA, tests were also made of flyover noise for the aircraft at 6100m (20,000 ft) and 10,668m (35,000 ft). A final series of tests were flown to evaluate an advanced cabin wall noise treatment that was produced under a separate program by NASA-Langley Research Center.

### **MEASUREMENT EFFECTS ON THE CALCULATION OF IN-FLIGHT THRUST FOR AN F404 TURBOFAN ENGINE**

TIMOTHY R. CONNERS Sep. 1989 24 p Presented at the AIAA Joint Propulsion Conference, Monterey, CA, 10-14 Jul. 1989 Previously announced in IAA as A89-46777 (NASA-TM-4140; H-1556; NAS 1.15:4140; AIAA-89-2364) Avail: NTIS HC A03/MF A01 CSCL 21/5

A study was performed that investigates parameter measurement effects on calculated in-flight thrust for the General Electric F404-GE-400 afterburning turbofan engine which powered the X-29A forward-swept wing research aircraft. Net-thrust uncertainty and influence coefficients were calculated and are presented. Six flight conditions were analyzed at five engine power settings each. Results were obtained using the mass flow-temperature and area-pressure thrust calculation methods, both based on the commonly used gas generator technique. Thrust uncertainty was determined using a common procedure based on the use of measurement uncertainty and influence coefficients. The effects of data nonlinearity on the uncertainty calculation procedure were studied and results are presented. The advantages and disadvantages of using this particular uncertainty procedure are discussed. A brief description of the thrust-calculation technique along with the uncertainty calculation procedure is included. Author

### **COMPUTATION OF RAMJET INTERNAL FLOWFIELDS Final Report, Jan. 1986 - Dec. 1988**

JAMES N. SCOTT, WILBUR L. HANKEY, and THOMAS P. GIELDA May 1989 91 p (Contract F33615-86-C-2615) (AD-A212001; WRDC-TR-89-2025) Avail: NTIS HC A05/MF A01 CSCL 21/1

This document reports on the computation of Ramjet Internal Flowfields. It is divided into two sections, i.e., subsonic and supersonic combustion. To numerically simulate subsonic combustion, the time-dependent Navier-Stokes equations are used with additional species equations incorporated to model hydrocarbon-air combustion. To compute supersonic combustion, the parabolized Navier-Stokes equations are utilized (PNS) with species equations to simulate hydrogen-air combustions. Model cases are computed and compared with limited experimental data. GRA

### **AN OPEN-LOOP TRANSIENT THERMODYNAMIC MODEL OF THE COUGUAR TURBOJET**

P. C. FRITH Apr. 1989 69 p (AD-A211774; ARL-PROP-TM-457; DODA-AR-005-582) Avail: NTIS HC A04/MF A01 CSCL 21/5

An open-loop, transient, thermodynamic model of the single-spool Couguar turbojet was developed for use in both fault

diagnosis and engine control research work. The model is based on TURBOTRANS, a generic engine modeling computer program, and it was calibrated against test cell measurements of the steady-state running line. The model provided good predictions of a series of accelerations and decelerations over the operating range of the turbojet. Estimates of the steady-states gains and time constants, across the speed range of the engine, are also presented. GRA

### **THE RB199: AN IN-SERVICE SUCCESS**

K. FLANDERS 13 Apr. 1987 7 p Presented at the SBAC Symposium (Multi Purpose Combat Aircraft), Belgrade, Yugoslavia, 13-14 Apr. 1987 (PNR90544; ETN-89-95542) Copyright Avail: NTIS HC A02/MF A01

The performance of the RB199 engine is assessed. The modular design, on-condition maintenance and flexibility of the engine are described. There is no fixed time between overhauls on these engines. Repairs are carried out only to remedy a diagnosed fault. The reliability rates nonetheless compare favorably with any other military engine. The maintenance record for these engines, which have completed over 500,000 flying hours in Tornado aircraft, is fully documented. ESA

### **ADVANCED TECHNOLOGY IN MILITARY GAS TURBINE DESIGN AND MANUFACTURE**

B. J. QUINN 13 Apr. 1987 9 p Presented at the SBAC Symposium (Multi Purpose Combat Aircraft), Belgrade, Yugoslavia, 13-14 Apr. 1987 (PNR90545; ETN-89-95543) Copyright Avail: NTIS HC A02/MF A01

The interaction of design and manufacturing technology in achieving high engine and component efficiency is described. The use of high precision three dimensional aerodynamic design and manufacturing methods is described. The goal of the research, to obtain a high thrust/weight ratio in combat, but a low fuel consumption while patrolling to minimize aircraft size, is outlined. This goal is achieved by using high flame temperatures, medium bypass ratios, high overall pressure ratios and good component efficiencies. ESA

**N90-11748#** Rolls-Royce Ltd., Derby (England). Controls and Electronics Group.

### **ENGINE CONTROLS FOR THE 1990'S**

V. A. FISHER 13 Apr. 1987 6 p Presented at the SBAC (Multi Purpose Combat Aircraft), Belgrade, Yugoslavia, 13-14, Apr. 1987 (PNR90546; ETN-89-95544) Copyright Avail: NTIS HC A02/MF A01

The development of controls with increased emphasis on minimum hydromechanics and use of digital techniques is discussed. Changes in the way that designs are specified, and subsequent changes in maintenance attitudes are necessary, to fully exploit these more sophisticated systems. The concept of the engine control systems for the 1990s is described. Arguments of how integrity, reliability and control system performance will be obtained are presented. ESA

**N90-11749#** Rolls-Royce Ltd., Derby (England).

### **FUTURE MILITARY POWERPLANTS**

W. J. LEWIS 21 May 1988 20 p Presented at the I. Mech. E. Seminar for 21st Century Aero-Engine Design, 21 May 1988 (PNR90554; ETN-89-95547) Copyright Avail: NTIS HC A03/MF A01

The importance of fighter aircraft engine development as the leading edge of technological development is outlined. It is expected that fighter engines of the next century will continue to follow the trends already established. Thrust over weight ratios will increase and fuel consumption and costs will be reduced. The use of composites will become more widespread. It is likely

that development of new materials, manufacturing processes, and aerodynamic and thermodynamic techniques will be the major areas of technological development. ESA

**COATINGS FOR GAS TURBINE COMPRESSORS**

H. J. KOLKMAN 8 Jul. 1988 10 p Presented at the Materials Developments in Turbomachinery Design Conference, Cambridge, United Kingdom, 12-14 Sep. 1988 Sponsored in part by the Royal Netherlands Air Force (NLR-MP-88045-U; ETN-89-95057) Avail: NTIS HC A02/MF A01

A number of compressor coatings with supposedly high erosion resistance are investigated. Both the erosion and corrosion resistances of these coatings are investigated under simulated service conditions in the NLR (National Aerospace Laboratory) compressor test rig. Uncoated helicopter jet engine compressors have experienced severe pitting problems in the Western European environment. Moisture absorbed by hygroscopic salts, acidified by air pollutants such as sulfur dioxide and nitrogen dioxide, caused pitting corrosion (manifested by the presence of metal ions). Magnesium chloride, a natural marine salt, supplies the chloride ions which attack the protective oxide layer of stainless steels. It is concluded that the ideal compressor coating is not yet available. ESA

**STAGE EFFECTS ON STALLING AND RECOVERY OF A HIGH-SPEED 10-STAGE AXIAL-FLOW COMPRESSOR Ph.D. Thesis**

WILLIAM WARD COPENHAVER 1988 400 p Avail: Univ. Microfilms Order No. DA8909139

Results of a high speed 10-stage axial flow compressor test involving overall compressor and individual stage performance while stalling and operating in quasi-steady rotating stall are described. Test procedures and data acquisition methods used to obtain the dynamic stalling and quasi-steady in-stall data are explained. Unstalled and in-stall time averaged data obtained from the compressor operating at five different shaft speeds and one off-schedule variable vane condition are presented. The effects of compressor speed and variable geometry on overall compressor in-stall pressure rise and hysteresis extent are illustrated through the use of quasi-steady stage temperature rise and pressure rise characteristics. The results indicate that individual stage performance during overall compressor rotating stall operation varies considerably throughout the length of the compressor. Time resolved in-stall data acquired at two different shaft speeds are presented in support of the notion that stage operation varies significantly from entrance to exit of the compressor. Both time-averaged and time-resolved individual stage results suggest that stage matching is important, not only for unstalled performance but also for in-stall performance and recoverability from stall. The measured high speed 10-stage test compressor individual stage pressure and temperature characteristics were input into a stage-by-stage dynamic compressor performance model. The analytical model had been previously validated for the prediction of low-speed compressor stalling and in-stall performance. Dynamic pressures measured during stalling of the high speed 10-stage test compressor are compared during stalling of the high speed 10-stage test compressor are compared with analytical model results. The comparison of the model results and with analytical model results. The comparison of the model results and the measured pressures provided the additional validation necessary to demonstrate the model's ability to predict high speed multistage compressor stalling and in-stall performance. Dissert. Abstr.

**A VISION OF THE FUTURE: THE NEW ENGINE TECHNOLOGY**

P. C. RUFFLES 21 Aug. 1988 9 p Presented at the Financial Times Conference on Commercial Aviation to the End of the Century, London, England, 31 Aug. 1988 (PNR90566; ETN-89-95551) Copyright Avail: NTIS HC A02/MF A01

Predictions of future trends in engine design and technology are presented. These include reduction of fuel consumption with further improvement to current high bypass ratio engines and later by application of ultrahigh bypass ratio technology. Aircraft and engines are predicted as becoming larger. Large twin engine aircraft will require ever larger thrusts. The need for new materials in order to develop a light weight ultrahigh bypass ratio engine is stressed. Computer integration of design and manufacture processes is predicted for the lowering of development and production costs of such an engine. ESA

**THE ROLE OF COMPONENT TESTING**

G. ASQUITH 26 Apr. 1989 14 p Presented at the 68th AGARD Structures and Materials Panel Meeting, Ottawa, Ontario, 26 Apr. 1989 (PNR90589; ETN-89-95562) Copyright Avail: NTIS HC A03/MF A01

The importance of component testing in ensuring that design and life goals of engines are met is addressed. The integration of

## 07 AIRCRAFT PROPULSION AND POWER

component testing and material data generation into a material data bank is described. The techniques of stress and fracture mechanics analysis, crack monitoring, metallography and probabilistic approaches are used in establishing this data bank. The use of data on the material behavior of components in the development of new and improved materials is stressed. ESA

**N90-12609#** Rolls-Royce Ltd., Derby (England).

### **FLANGED JOINTS OF AEROENGINES**

L. V. LEWIS, H. FESSLER, and T. H. HYDE (Nottingham Univ., England) 4 Sep. 1989 12 p Presented at the 9th International Symposium on Air Breathing Engines, Athens, Greece, 4-9 Sep. 1989

(PNR90594; ETN-89-95565) Copyright Avail: NTIS HC

A03/MF A01

The design of a metal-to-metal bolted joint between two aeroengine casings is described. The joint has to achieve structural integrity and perform a sealing function. It must be light and have a small number of bolts. It is shown that present joints often fail to seal, and suffer high cyclic stresses in the bolts and in the flange profiles. A way of pre-loading the joint on assembly is presented. It involves machining a cone angle onto the flange faces, so that a high-intensity line reaction is generated at the inside diameter on assembly. It is shown that perfect sealing can be achieved, and maintained at ratios of axial joint load/assembly bolt load that exceed present practice. Cyclic stresses are reduced to negligible proportions, so that low cycle fatigue is no longer a potential failure mode. It is shown that assembly stresses can be kept within elastic limits with acceptably light flange profiles.

### **MATERIAL REQUIREMENTS FOR FUTURE AEROENGINES**

G. E. KIRK 4 Sep. 1989 8 p Presented at the 9th International Symposium on Air Breathing Engines, Athens, Greece, 4-9 Sep. 1989

(PNR90595; ETN-89-95566) Copyright Avail: NTIS HC

A02/MF A01

Improvements made in aeroengine technology are summarized. Performance gains, longer engine lives and higher thrust to weight ratio obtained through materials and process technology which made a significant contribution to this progress are outlined. For materials with higher temperature capability, lower cost and increased strength and stiffness in the future is stressed. Planned aeroengine configurations will not be viable without improvements in material properties and manufacturing technology. The developmental potential of titanium and nickel, and that of newer composite materials is outlined in terms of their use in future aeroengines. The problems that must be solved before they can be effectively used are identified.

### **A COMPUTER INTEGRATED APPROACH TO DIMENSIONAL INSPECTION**

S. A. LEE, N. TSABOURAKIS, M. RISTIC, and C. B. BESANT 3 Sep. 1989 10 p Presented at the 9th International Symposium on Air Breathing Engines, Athens, Greece, 4-9 Sep. 1988

(PNR90596; ETN-89-95567) Copyright Avail: NTIS HC

A02/MF A01

A computer integrated dimensional inspection system supporting contact and noncontact methods of surface digitization is described. An extensive error handling facility enables errors to be found between nominal and actual surfaces. These errors may be presented, for example as contours of error, or be used in a three dimensional best-fitting process which minimizes error between actual and nominal surfaces. The design and development of the system are given in outline with a resume of its use. The system proves to be very powerful in dealing with the inspection of the highly complex forms involved in turbine blading.

### **DYNAMIC TIP CLEARANCE MEASUREMENTS IN AXIAL FLOW COMPRESSORS**

C. J. PARRISH 15 Sep. 1989 6 p Presented at the COMADEM 89 International, Birmingham, England, Sep. 1989

(PNR90597; ETN-89-95568) Copyright Avail: NTIS HC

A02/MF A01

Techniques used in measurement of tip clearance and the detection of tip rubs between rotor blade tips and rotor path lining in the compressors of jet engines are described. The importance of such measurements in obtaining engine efficiency is stressed. Tip clearance results broken down into closure, surge, and orbit types, are discussed. It is concluded that tip rubs occur during surge with a resultant loss in compressor efficiency. Closures are measured with rotor orbit to obtain the best cold build clearances for maximum compressor efficiency.

### **THE DEVELOPMENT OF A HIGH RESPONSE AERODYNAMIC WEDGE PROBE AND USE ON A HIGH-SPEED RESEARCH COMPRESSOR Ph.D. Thesis - Cranfield Inst. of Technology**

S. C. COOK 4 Sep. 1989 14 p Presented at the 9th International Air Breathing Engines, Athens, Greece, 4-9 Sep. 1988 Sponsored by the Ministry of Defence, London, England and the United Kingdom Science and Engineering Research Council

(PNR90598; ETN-89-95569) Copyright Avail: NTIS HC

A03/MF A01

A high response aerodynamic wedge probe developed for use in performance testing of high-speed, axial-flow, research compressors and fans is described. The miniature probe incorporates flush-mounted high response silicon piezo-resistive pressure transducers, with both a dynamic and steady state measurement capability. New information on wedge probe aerodynamic sensitivity is given and details of important improvements to an iterative data reduction algorithm, facilitating successful use on dynamic data, are included. An electronic compensation scheme is employed to overcome the inherent temperature sensitivity of the transducers. Using this system, previously unreported transducer output nonlinearities are revealed. The 30 degree included angle wedge probe has a frequency response in excess of 100 kHz. The wedge probe was applied to a highspeed (9 kHz blade passing frequency), single-stage, axial-flow, research compressor at rotor trailing edge. Time resolved rotor wakes were measured using the wedge probe and compared with rotating wake data obtained using a crossed hot wire anemometer probe. The rotor wakes were found to be highly unsteady in terms of both amplitude and spatial location.

### **BLADING DESIGN FOR MULTI-STORAGE HP COMPRESSOR**

P. STOW 13 Mar. 1989 43 p Presented at the AGARD LS167 on Blading Design for Axial Turbomachines, Jun. 1987

(PNR90602; TSG0428; ETN-89-95573) Copyright Avail: NTIS HC A03/MF A01

Computer aided turbomachinery blade design is discussed with the emphasis on the mathematical models needed to account for physical phenomena. The various aspects of a typical blade design system are presented covering through-flow and blade-to-blade analysis. The through-flow aspects such as linked through-flow-blade-to-blade analysis, blade loss models, end-wall boundary layers, secondary flow analysis and spanwise mixing

models are discussed. Blade section design using mixed design and analysis methods is covered. Loss prediction using coupled inviscid boundary layer approaches is carried out. Limitations of the coupled approach are discussed together with the emerging role of Reynolds averaged Navier-Stokes methods aimed at removing these limitations. The need for fully three dimensional methods and their incorporation into the design system are discussed. Areas for future development and application are discussed. ESA

NTIS HC A08/MF A01 CSCL 21/5

Discussed is Static Rotor Testing of the SR-7L Large Scale Advanced Prop-Fan (LAP). The LAP is an advanced 9 foot diameter, 8 bladed propeller designed and built by Hamilton Standard under contract to the NASA Lewis Research Center. The Prop-Fan employs thin swept blades to provide efficient propulsion at flight speeds up to Mach .85. Static Testing was conducted on a 10,000 HP whirl rig at Wright Patterson Air Force Base. The test objectives were to investigate the Prop-Fan static aerodynamic and structural dynamic performance, determine the blade steady state stresses and deflections and to measure steady and unsteady pressures on the SR-7L blade surface. The measured performance of the LAP correlated well with analytical predictions at blade pitch angles below 30 deg. A stall buffet phenomenon was observed at blade pitch angles above 30 deg. This phenomenon manifested itself by elevated blade vibratory stress levels and lower than expected thrust produced and power absorbed by the Prop-Fan for a given speed and blade angle. Author

**STUDIES OF GAS TURBINE HEAT TRANSFER AIRFOIL SURFACES AND END-WALL COOLING EFFECTS Final Report, 1 Mar. 1986 - 28 Feb. 1989**

E. R. ECKERT, R. J. GOLDSTEIN, S. V. PATANKAR, and T. W. SIMON Jul. 1989 90 p

(Contract F49620-85-C-0049)

(AD-A212451; AFOSR-89-1225TR) Avail: NTIS HC A05/MF A01 CSCL 21/5

Understanding and prediction of the heat transfer in a turbine is dependent first on understanding the complex three-dimensional flow that occurs around a blade. In a turbine passage there are complex (interacting) vortices, significant variation in surface curvature, flow separation, transition from laminar to turbulent flow and perhaps relaminarization, and the influence of high turbulence level in the free stream flow. Heat or mass transfer measurements, aside from providing the needed design information, can also tell a great deal about the flow. The transport of heat or mass was used to detect characteristics of flow which were not readily detectable by other means. Modeling for computation of the flow and heat transfer, also, require knowledge of the flow as well as transport data to check the validity of models and their accuracy. GRA

**ON A PITCH CONTROL LAW FOR A CONSTANT GLIDE SLOPE THROUGH WINDSHEARS**

L. M. B. C. CAMPOS (Instituto Superior Tecnico, Lisbon, Portugal) Aeronautical Journal (ISSN 0001-9240), vol. 93, Oct. 1989, p. 290-300. Research supported by the Instituto Nacional de Investigacao Cientifica. refs

Copyright

The present equations of motion for an aircraft's constant glide-slope in the presence of arbitrary headwinds or tailwinds and upflows or downflows are integrated analytically. The case of an approach through downburst conditions leads to winds that can be simplified to the conditions of a one-period sinusoidal wind along the flight-path which changes from a headwind to a tailwind. Data sheets are presented for three combinations of the head-to-tailwind amplitude and downflow intensity; each sheet contains plots of the aircraft-incidence schedule that will exactly cancel the windshear effects, together with the ground-speed and air-speed profiles that will keep the aircraft flying along the original glide slope. O.C.

**A LOW COST STALL/SPIN SIMULATOR**

M. G. NAGATI (Wichita State University, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 10 p.

(Contract DOT-FA03-86-R-60039)  
(SAE PAPER 891022) Copyright

A method for simulating flight conditions into stall, poststall spin entry and steady state spin has been developed using a high performance graphics workstation. Its objective is to provide an easy and low-cost means of evaluating the high angular rate and high angle of attack handling qualities of preliminary general aviation configurations. Wing forces and moments are integrated over the span to provide real-time solutions of the full nonlinear equations of motion and provide visual simulation of aircraft motion from the pilot's viewpoint, or an outside view of the aircraft. The technique was found to be in good agreement with flight test data of a light aircraft, and offers a simple means of assessing the stall/spin characters of light aircraft configurations. Author

## INVESTIGATIONS OF MODIFICATIONS TO IMPROVE THE SPIN RESISTANCE OF A HIGH-WING, SINGLE-ENGINE, LIGHT AIRPLANE

G. S. MANUEL, D. J. DICARLO, H. P. STOUGH, III, P. W. BROWN, and R. A. STUEVER (NASA, Langley Research Center, Hampton, VA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 9 p. refs  
(SAE PAPER 891039) Copyright

A general aviation aircraft with drooped leading edge modifications for improvement of lateral stability at high angles of attack has been flight tested in combination with a ventral fin which improves directional stability. The two modifications were assessed in light of spin-resistance criteria proposed for incorporation into FAA certification regulations. The configuration combining outboard wing leading-edge droop and a ventral fin yielded a substantial increase in spin resistance, but fell short of all requirements encompassed by the proposed spin-resistance criteria. O.C.

## **A90-14355** **REAL-TIME DECISION MAKING FOR AUTONOMOUS FLIGHT CONTROL**

SULYUTH SWANGWANNA (Wichita State University, KS) and JAN M. ZYTKOW (George Mason University, Fairfax, VA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 9 p. Research supported by DARPA. refs  
(Contract DAAL03-87-G-0003; N00014-87-K-0874)  
(SAE PAPER 891053) Copyright

This paper describes a software system that makes real time decisions for an autonomous airplane in a simulated combat environment. It utilizes a network of plans and goals and selects them dynamically, according to the changing circumstances and to the mission goals. Architecture of the system allows for quick, hierarchical selection of plans and flexible execution by adjusting plan instantiation to the varying situation. The system monitors its own performance, checking for the safety, resources, and effectiveness of currently executed plans and dropping those that become dangerous or counterproductive. The architecture of the system allows for a prompt response to dangerous situations by suspending the currently executed plan and invoking an emergency plan. The system can follow commands from the formation leader or ground control. Commands may be very specific, but the system can also follow commands on higher levels of abstraction, deciding autonomously on necessary details. Author

STANISLAW BOCIEK and ANDRZEJ TOMCZYK (Rzeszow, Politechnika, Poland) Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 114-115, 1988, p. 22-39. In Polish. refs

The present paper contains a simplified analysis of the behavior of an aircraft with a control system in which the displacement of the elevator is accompanied by an appropriate displacement of the flaps. This is possible to achieve by direct lift control, the application of which modifies the flying qualities of the aircraft, some transient processes being changed as well as some aerodynamic characteristics. To enable an estimate of these phenomena, an efficacy index is introduced for direct lift control, and its influence on these characteristics is studied. A numerical example is given to show the usefulness of the index and to illustrate the results of an application of the aircraft control technique. Author

## **A90-15424#** **EVALUATION OF THE DYNAMIC PROPERTIES OF THE AUTO-PILOT SERVO OF A SINGLE-ROTOR HELICOPTER THROUGH LABORATORY TESTING [OCENA WLASNOSCI DYNAMICZNYCH SERWOMECHANIZMU WYKONAWCZEGO AUTOPILOTA HELIKOPTERA JEDNOWIRNIKOWEGO DROGA BADAN LABORATORYJNYCH]**

PIOTR TOMASZEWICZ (Instytut Lotnictwa, Warsaw, Poland) Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 114-115, 1988, p. 40-54. In Polish.

The subject matter of the present discussion are the results of tests of the dynamics of the control servo of a single-rotor helicopter. The structure of the servo, which is treated as a control system, is divided into a control part and a motor part. The results of the measurement of the time constant and the maximum velocity of the control part of the servo are presented as a function of the gain of the feedback loop. It is shown that the dynamic possibilities of the actuator motor part are not fully used by the control part in the course of operation of the device in the autopilot system. The cause of the unsatisfactory dynamic properties of the electrohydraulic control servo is shown to lie in the structure of the electronic part of the servo and consist in the narrow adjustment

margin of the gain of the feedback loop. The results of the analysis show the importance of making, at the stage of preliminary design, correct technical assumptions for each particular subassembly.

A coupled rotor/fuselage helicopter analysis with the important effects of blade torsional flexibility, unsteady aerodynamics, and forward flight is presented. This model is used to illustrate the effect of unsteady aerodynamics, forward flight, and torsional flexibility on air resonance. Next, a nominal configuration, which experiences air resonance in forward flight, is selected. A simple multivariable compensator using conventional swashplate inputs and a single body roll rate measurement is then designed. The controller design is based on a linear estimator in conjunction with optimal feedback gains, and the design is done in the frequency domain using the loop-transfer recovery method. The controller is shown to suppress the air resonance instability throughout wide range helicopter loading conditions and forward flight speeds.

**LOW-SPEED WIND-TUNNEL STUDY OF REACTION CONTROL-JET EFFECTIVENESS FOR HOVER AND TRANSITION OF A STOVL FIGHTER CONCEPT**

DONALD R. RILEY, GAUTAM H. SHAH, and RICHARD E. KUHN (Kuhn, Richard E., San Diego, CA) Washington Dec. 1989 39 p

(NASA-TM-4147; L-16616; NAS 1.15:4147) Avail: NTIS HC A03/MF A01 CSCL 01/3

A brief wind-tunnel study was conducted in the Langley 12-Foot Low-Speed Tunnel to determine reaction control-jet effectiveness and some associated aerodynamic characteristics of a 15 percent scale model of the General Dynamics E-7A STOVL fighter/attack aircraft concept applicable to hover and transition flight. Tests were made with the model at various attitude angles in the tunnel test section and at various tunnel airspeeds for a range of control-jet nozzle pressure ratios. Eight reaction control-jets were tested individually. Four jets were at the design baseline locations providing roll, pitch, and yaw control. Comparisons of measured data with values calculated using empirical methods were made where possible.

Advanced flight control system design, analysis, and testing methodologies developed at the Ames Research Center are applied in an analytical and flight test evaluation of the Advanced Digital Optical Control System (ADOCS) demonstrator. The primary objectives are to describe the knowledge gained about the implications of digital flight control system design for rotorcraft,

and to illustrate the analysis of the resulting handling-qualities in the context of the proposed new handling-qualities specification for rotorcraft. Topics covered in-depth are digital flight control design and analysis methods, flight testing techniques, ADOCS handling-qualities evaluation results, and correlation of flight test results with analytical models and the proposed handling-qualities specification. The evaluation of the ADOCS demonstrator indicates desirable response characteristics based on equivalent damping and frequency, but undesirably large effective time-delays (exceeding 240 m sec in all axes). Piloted handling-qualities are found to be desirable or adequate for all low, medium, and high pilot gain tasks; but handling-qualities are inadequate for ultra-high gain tasks such as slope and running landings.

**A DESIGN PROCEDURE FOR THE HANDLING QUALITIES OPTIMIZATION OF THE X-29A AIRCRAFT**

JOHN T. BOSWORTH and TIMOTHY H. COX Sep. 1989 21 p Presented at the Guidance, Navigation, and Control Conference, Boston, MA, 14-16 Aug. 1989 Previously announced in IAA as A89-52529

(NASA-TM-4142; H-1548; NAS 1.15:4142; AIAA-89-3428) Avail: NTIS HC A03/MF A01 CSCL 01/3

A design technique for handling qualities improvement was developed for the X-29A aircraft. As with any new aircraft, the X-29A control law designers were presented with a relatively high degree of uncertainty in their mathematical models. The presence of uncertainties, and the high level of static instability of the X-29A caused the control law designers to stress stability and robustness over handling qualities. During flight test, the mathematical models of the vehicle were validated or corrected to match the vehicle dynamic behavior. The updated models were then used to fine tune the control system to provide fighter-like handling characteristics. A design methodology was developed which works within the existing control system architecture to provide improved handling qualities and acceptable stability with a minimum of cost in both implementation as well as software verification and validation.

**STABILITY AND CONTROL DERIVATIVES OF THE DE HAVILLAND DHC-2 BEAVER AIRCRAFT**

R. T. H. TJEE and J. A. MULDER Aug. 1988 151 p (PB89-217525; LR-556) Avail: NTIS HC A08/MF A01 CSCL 01/3

The report presents a database of stability derivatives of the De Havilland DHC-2 BEAVER experimental aircraft of the Delft University of Technology at various stationary nominal flight conditions. To compute these stability derivatives a nonlinear aerodynamic model is used. The flight test data of this model is based on data derived from the DHC-2 BEAVER test flights of the 1977 and 1978 period. The stability derivatives are presented at several nominal flight conditions throughout the normally used flight envelope of the aircraft.

**ROBUST CONTROL DESIGN FOR FLIGHT CONTROL Final Report, Jul. 1988 - Mar. 1989**

WILLIAM H. BENNETT, HAROLD G. KWATNY, and KEITH GLOVER Jul. 1989 92 p (Contract F33615-88-C-3606)

(AD-A211957; TSI-89-04-06-WB; WRDC-TR-89-3063) Avail: NTIS HC A05/MF A01 CSCL 01/4

The application of new and advanced methods of control law synthesis for robust stabilization were studied with respect to a combination of both unstructured model uncertainty (arising from neglected parasitic dynamics) and structured model uncertainty (arising from parametric variations which occur as flight conditions change). Efforts focused on the characterization of a class of nonlinear models for longitudinal dynamics of aircraft in level flight subject to changes in static stability. Such relaxed stability aircraft

## 08 AIRCRAFT STABILITY AND CONTROL

configurations are currently at issue in a wide variety of advanced designs including commercial transport and high performance aircraft. The control design approach employs H-infinity synthesis methods for optimal robust stabilization for the unstructured model uncertainty, and the requirement of worst case (i.e., robust) design for parametric uncertainty is included using a minimax optimization criteria. A class of flight control models with physically based parametric uncertainty were examined. For these models, the solution of the minimax or worst case design is achieved by a straightforward procedure which can be readily combined with the requirements for robustness to parasitic dynamics using the closed form solution of the optimal robust stabilization method. ### **COMPARISON OF FLYING QUALITIES DERIVED FROM IN-FLIGHT AND GROUND-BASED SIMULATORS FOR A JET-TRANSPORT AIRPLANE FOR THE APPROACH AND LANDING PILOT TASKS**

WILLIAM D. GRANTHAM Washington Dec. 1989 32 p (NASA-TP-2962; L-16609; NAS 1.60:2962) Avail: NTIS HC A03/MF A01 CSCL 01/3

The primary objective was to provide information to the flight controls/flying qualities engineer that will assist him in determining the incremental flying qualities and/or pilot-performance differences that may be expected between results obtained via ground-based simulation (and, in particular, the six-degree-of-freedom Langley Visual/Motion Simulator (VMS)) and flight tests. Pilot opinion and performance parameters derived from a ground-based simulator and an in-flight simulator are compared for a jet-transport airplane having 32 different longitudinal dynamic response characteristics. The primary pilot tasks were the approach and landing tasks with emphasis on the landing-flare task. The results indicate that, in general, flying qualities results obtained from the ground-based simulator may be considered conservative-especially when the pilot task requires tight pilot control as during the landing flare. The one exception to this, according to the present study, was that the pilots were more tolerant of large time delays in the airplane response on the ground-based simulator. The results also indicated that the ground-based simulator (particularly the Langley VMS) is not adequate for assessing pilot/vehicle performance capabilities (i.e., the sink rate performance for the landing-flare task when the pilot has little depth/height perception from the outside scene presentation). ### **ADAPTIVE CONTROL LAW DESIGN FOR MODEL UNCERTAINTY COMPENSATION Final Report, Aug. 1988 - Jan. 1989**

J. E. SORRELLS 14 Jun. 1989 96 p (Contract F33615-88-C-3609; AF PROJ. 3005) (AD-A211712; TR-89-WPAFB-3609-033; WRDC-TR-89-3061) Avail: NTIS HC A05/MF A01 CSCL 01/4

Disturbance Accommodating Control (DAC) principles were applied to the design of a baseline aerospace flight control system. The resulting DAC controller designs were evaluated in terms of their ability to maintain an ideal model response when the closed loop system was subjected to significant uncertainties. These uncertainties included parameter perturbations, external disturbances, and unmodelled dynamics. The DAC designs were compared to other adaptive techniques, including Self-Tuning Regulator (STR) and Model Reference Adaptive Control (MRAC) concepts. These designs were also compared to a classical Proportional-Integral-Derivative (PID) controller. All of the adaptive controller designs were judged relative to each other and relative to the PID design, in terms of performance, design, complexity, and confidence of operation (reliability). In every case the controllers designed using Dynetics innovative approach were able to equal or surpass the STR and MRAC controllers in terms of performance robustness while preserving a linear time-invariant implementation structure. ### **CONTROLLER DESIGN FOR ACTIVE VIBRATION SUPPRESSION OF A HELICOPTER**

NORBERT GAUS and REINHOLD STEINHAUSER Jan. 1989 141 p In GERMAN; ENGLISH summary (DFVLR-FB-89-20; ISSN-0171-1342; ETN-89-95315) Avail: NTIS HC A07/MF A01; DFVLR, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Federal Republic of Germany, 49.50 deutsche marks

A controller is designed to suppress vibrations, which are transmitted from the helicopter rotor to its fuselage. To solve the corresponding regulator problem by output-feedback, notch-filters are introduced in the controller structure. A comprehensive linear system analysis, where invariant system zeros give major hints, leads to a suitable extension of the controller structure and an initial controller design. The final controller coefficients are determined by optimizing a vector performance index. The result is compared to linear quadratic optimal controllers and then checked for robustness taking both model extensions and sensor or actuator failing into consideration. ESA

### **A ROBUST DIGITAL MODEL FOLLOWING CONTROLLER FOR HELICOPTERS**

GERHARD BOUWER (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick, Germany, F.R.) Apr. 1989 159 p Transl. into ENGLISH of Ein Robuster Digitaler Modellfolgeregler fuer Hubschrauber (Brunswick, Fed. Republic of Germany, DFVLR), Jan. 1988 157 p Original language document was announced as N88-27203 (ESA-TT-1041; DFVLR-FB-88-07; ETN-89-95389) Avail: NTIS HC A08/MF A01; original German version available from DFVLR, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Fed. Republic of Germany, 40.50 Deutsche marks

The development, design and testing of a model following control system for helicopters is reported. In order to comply with the operating limits, a special actuator simulation system is developed. The investigations are based on a model with simple dynamics and a model for flight simulation. Numerical simulation is applied to investigate the effectiveness of the closed loop control system both in model following control and in disturbance rejection. The limits of model following control are illustrated by variation in model parameters. The possibilities of inflight simulation are demonstrated. ESA

**CRITERIA FOR EVALUATING THE FLIGHT DYNAMICS MODEL OF FLIGHT SIMULATORS [KRYTERIA OCENY MODELU DYNAMIKI LOTU W TRENINGOWYCH SYMULATORACH LOTU]**

JANUSZ M. MORAWSKI Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 114-115, 1988, p. 3-21. In Polish. refs

The principal aspects of developing a flight dynamics model for a flight simulator are discussed. Some methods for reducing the initial model, both classical and based on a pragmatic simulation, are considered. The latter concept adopts as a criterion of similarity between the simulation model and the real flight, the identity of the perceptions of the simulator used and the real pilot. Some objective and subjective criteria for evaluating a model are formulated according to the principles of pragmatic approach. The aim of these procedures is, in general, to make a subjective evaluation as reliable as the measurement results. Author

**WIND TUNNEL TESTING OF HIGH BLOCKAGE MODELS**

M. SHIVAKUMARA SWAMY (National Aeronautical Laboratory, Bangalore, India) Aeronautical Society of India, Journal (ISSN 0001-9267), vol. 40, May 1988, p. 119-130.

Sophisticated methods have become available for computing wind tunnel boundary corrections; this has facilitated the use of smaller wind tunnel facilities with relatively large models, involving higher blockage ratios than previously used. This paper describes an effort to verify this concept by correlating test results on a wing-body model obtained from a smaller tunnel with those from a larger tunnel after applying appropriate corrections. It is verified

## 09 RESEARCH AND SUPPORT FACILITIES (AIR)

that even smaller facilities can be used to test reasonably higher blockage models when sophisticated methods are available for the computation of the wall boundary corrections. B.J.

New-Tech News (ISSN 0935-2694), no. 3, 1989, p. 24, 25.

Copyright

This paper describes experiments performed in the ONERA high-speed wind tunnel with a large-scale (5-m 4.5-ton) wing model fitted with various control elements for varying the experimental setup and with numerous sensors and transmitters for taking measurements. Among the test parameters that were varied in these experiments were the Mach number, the angle of attack, the sweepback angle, and the combination of wing flaps and rigid wing sections. Results obtained when the half-scale wing 'flew' at a speed of about 900 km/hr demonstrated that a correlation exists between laminar flow across the wing in free flight and laminar flow in the wind tunnel under similar conditions. I.S.

**ANALYSIS OF HELIPORT ENVIRONMENTAL DATA: INDIANAPOLIS DOWNTOWN HELIPORT, WALL STREET HELIPORT. VOLUME 2: WALL STREET HELIPORT DATA PLOTS**

ROSANNE M. WEISS, JOHN G. MORROW, DONALD GALLAGHER, MARK DIMEO, and SCOTT ERLICHMAN May 1989 1128 p

(DOT/FAA/CT-TN87/54-VOL-2) Avail: Issuing Activity

During the summer of 1987 heliport environmental data were collected at Indianapolis Downtown Heliport and at New York's Wall Street Heliport. The purpose of this data collection activity was to obtain measures of rotorwash in the heliport environment due to maneuvering helicopters, and to obtain pilot perceptions and observations concerning maneuvering and parking separation criteria. Ten wind vector transmitters were situated at various locations around the heliport in order to gather information to describe the rotorwash induced wind speed and direction changes. Pilot interviews were also conducted at these heliports. Volume 1 of this report provides a summary of the results of this activity. Volume 3 provides the plots generated from the wind sensor data collected at the Indianapolis Downtown Heliport. This volume (Volume 2) provides the plots generated from the wind sensor data collected at New York's Wall Street Heliport. The results of this study will be considered in future modifications of the Federal Aviation Administration (FAA) Heliport Design Advisory Circular, AC 150/5390-2. Author

**ILS MATHEMATICAL MODELING STUDY OF THE EFFECTS OF PROPOSED HANGAR CONSTRUCTION AT THE ORLANDO INTERNATIONAL AIRPORT, RUNWAY 17R, ORLANDO, FLORIDA Technical Report, Aug. 1989**

JAMES D. RAMBONE and JOHN E. WALLS Sep. 1989 21 p

(DOT/FAA/CT-TN89/52) Avail: NTIS HC A03/MF A01

Described here is the instrument landing system (ILS) math modeling performed by the Federal Aviation Administration (FAA) Technical Center at the request of the Southern Region. Computed localizer data are presented showing the effects of two hangar buildings (Branniff and Comair) on the performance of an ILS localizer proposed for runway 17R at the Orlando International Airport. The Southern Region is concerned that radio frequency (RF) signal reflections from the two hangars may degrade the localizer course beyond Category II/III tolerances. Modeled course structure results indicate that Category II/III localizer performance should be obtained with the Wilcox Mark II, 14-element, dual-frequency log periodic antenna with both hangar buildings constructed at the currently proposed locations. Computed clearance orbit results indicate satisfactory linearity, course crossover, and signal clearance levels. Data are also presented showing the computed performance for a glide slope proposed

## 09 RESEARCH AND SUPPORT FACILITIES (AIR)

for runway 17R at the Orlando International Airport. The null reference glide slope will be located 1050 feet back from runway threshold and 400 feet left offset of centerline. Glide slope modeling computed only the effect of terrain in front of the antenna system and was conducted with the GTD-2D model because of limited terrain data availability. Modeled path structure and level run plots are provided for the proposed null reference system. Author

Avail: Defence Research Information Centre, Kentigern House, 65

Brown Street, Glasgow, G2 8EX, Scotland

Studies of the A300 Airbus aircraft were carried out in two pressurized low speed wind tunnels. Initially comparison of the results obtained in the two facilities, with the same model mounted on an identical three strut support, showed discrepancies which in the case of lift coefficient amounted to 2.5 percent. Comparison of all of the procedures used in processing the measurements led to a series of modifications in data reduction techniques in the two facilities. When these modifications are all taken into account, the results on lift and drag on the A300 provided by the two tunnels show good agreement, confirming the accuracy of the measurement techniques and the broad framework of the corrections. Light beams are altered by refractive index changes; flow induced refractive index changes provide the impetus for conventional visualization techniques such as schlieren and shadowgraph. Unfortunately effects related to the flow can be masked by refractive index inhomogeneities external to the test section. A simple shadowgraph scheme was used to assess the flow quality of the Langley 0.3 meter Transonic Cryogenic Tunnel. When the penetration tubes were evacuated the quality of the shadowgraph improved dramatically. B.G.

### **DESIGN AND FABRICATION REQUIREMENTS FOR LOW NOISE SUPERSONIC/HYPERSONIC WIND TUNNELS**

IVAN E. BECKWITH, FANG-JENG CHEN, and MUJEEB R. MALIK (High Technology Corp., Hampton, VA.) In its Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 947-964 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 14/2

A schematic diagram of the new proposed Supersonic Low Disturbance Tunnel (SLDT) is shown. Large width two dimensional rapid expansion nozzles guarantee wide quiet test cores that are well suited for testing models at large angle of attack and for swept wings. Hence, this type of nozzle will be operated first in the new proposed large scale SLDT. Test results indicate that the surface finish of pilot nozzles is critical. The local roughness Reynolds number criteria  $R_{sub k}$  is approx. = 10 will be used to specify allowable roughness on new pilot nozzles and the new proposed tunnel. Experimental data and calculations for  $M = 3.0$ , 3.5, and 5.0 nozzles give N-factors from 6 to 10 for transition caused by Goertler vortices. The use of N is approx. = 9.0 for the Goertler instability predicts quiet test cores in the new  $M = 3.5$  and  $M = 6.0$  axisymmetric long pilot nozzles that are 3 to 4 times longer than observed in the test nozzles to date. The new nozzles utilize a region of radial flow which moves the inflection point far downstream and delays the onset and amplification of the Goertler vortices. Author

**RESIDUAL INTERFERENCE ASSESSMENT IN ADAPTIVE WALL WIND TUNNELS**

A. V. MURTHY Sep. 1989 32 p  
 (Contract NAS1-18585)  
 (NASA-CR-181896; NAS 1.26:181896) Avail: NTIS HC A03/MF A01 CSCL 14/2

A two-variable method is presented which is suitable for on-line calculation of residual interference in airfoil testing in the Langley 0.3-Meter Transonic Cryogenic Tunnel (0.3-M TCT). The method applies the Cauchy's integral formula to the closed contour formed by the contoured top and bottom walls, and the upstream and downstream ends. The measured top and bottom wall pressures and position are used to calculate the correction to the test Mach number and the airfoil angle of attack. Application to specific data obtained in the 0.3-M TCT adaptive wall test section demonstrates the need to assess residual interference to ensure that the desired level of wall streamlining is achieved. A FORTRAN computer program was developed for on-line calculation of the residual corrections during airfoil tests in the 0.3-M TCT. Author

**ANALYTICAL AND EXPERIMENTAL STUDY OF RUNWAY RUNOFF WITH WIND EFFECTS Final Report, Feb. 1986 - Jun. 1989**

J. R. REED, D. F. KIBLER, and G. A. KRALLIS Oct. 1989 65 p Prepared for Naval Air Engineering Center, Lakehurst, NJ (Contract DOT-FA74WAI-432)  
 (PTI-8948; DOT/FAA/CT-TN89/59) Avail: NTIS HC A04/MF A01

This study is an extension of an earlier study that investigated the drainage efficiency of rectangular runway grooves in reducing runoff depths and the potential for hydroplaning. A mathematical model based on kinematic wave theory was developed and compared to the results of experiments conducted on a concrete slab subject to artificially produced rainfall. Parallel grooves were cut in the slab along its 30-ft length, which sloped at a typical 1.5 percent normal to the flight path. The 30-ft dimension models only the central portion of a single runway lane perhaps 100 ft wide. It was concluded that the grooves decreased runoff depths appreciably, more so as the spacing between grooves decreased. The current investigation adds wind velocity (15 mph) and direction to the variables considered in the previous study, with all other conditions essentially the same. This final report describes: (1) a kinematic wave model with wind superimposed (Phase 1); and (2) experiments conducted to calibrate the model (Phase 2). The hydraulic resistance of the slab and the calibration constants of the models were determined from the experiment. Curves of water depths versus position on a runway were predicted from the model and plotted out to 100 ft. Data points in the first 26 ft were plotted on the same graphs as a comparison. A conservative estimate of the runoff depth increase due to a direct cross wind to the runway is 0.04 inch for all conditions. Increases that are somewhat larger are restricted to smaller runoff depths. The breakout point for runoff in grooves appears to shift upstream about 25 percent of the breakout distance without wind. **PRELIMINARY ANALYSIS OF METHODOLOGY FOR ASSESSMENT OF PROPULSION SYSTEM FOR AEROSPACE PLANE**

ZHONG-YUAN YE (Ministry of Aerospace Industry, Beijing, People's Republic of China) IAF, International Astronautical Congress, 40th, Malaga, Spain, Oct. 7-13, 1989. 6 p. refs  
 (IAF PAPER 89-307) Copyright

The conclusions on the assessments of a propulsion system for an aerospacecraft are known to be sometimes quite discrepant or even contrary to each other. This paper analyzes the cause of such discrepancies, examining the impact of the assessment methodology on the conclusion. It is shown that the impact of some fixed-variables data on conclusion must be considered. An improvement in assessment can be made by both a further step-by-step suboptimization analysis and by taking into account the airframe/propulsion integration effect. The payload mass is not always sensitive to all variables within the whole range, and an uncertainty of some variables cannot be avoided. It is concluded that a sensitivity analysis is necessary to estimate the impact of some variables on conclusion; the variables that are sensitive within certain range should be considered as critical ones to be studied, while the insensitive variables can be neglected. **INFLUENCE OF SATELLITE GEOMETRY, RANGE, CLOCK, AND ALTIMETER ERRORS ON TWO-SATELLITE GPS NAVIGATION**

PHILIP D. BRIDGES (Nichols Research Corp., Huntsville, AL) IN:

ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 253-257.  
(Contract DASG60-85-C-0053)

Flight tests were conducted at Yuma Proving Grounds, Yuma, AZ, to determine the performance of a navigation system capable of using only two GPS satellites. The effect of satellite geometry, range error, and altimeter error on the horizontal position solution were analyzed for time and altitude aided GPS navigation (two satellites + altimeter + clock). The east and north position errors were expressed as a function of satellite range error, altimeter error, and east and north Dilution of Precision. The equations for the Dilution of Precision were derived as a function of satellite azimuth and elevation angles for the two satellite case. The expressions for the position error were then used to analyze the flight test data. The results showed the correlation between satellite geometry and position error, the increase in range error due to clock drift, and the impact of range and altimeter error on the east and north position error. ##### **DYNAMIC INTERACTION OF SEPARATE INS/GPS KALMAN FILTERS (FILTER-DRIVING - FILTER DYNAMICS)**

JOSEPH R. CUNNINGHAM and ZDZISLAW H. LEWANTOWICZ (USAF, Institute of Technology, Wright-Patterson AFB, OH) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 273-281. refs

This paper examines the basic behavior of the inertial navigation system (INS) errors under high-dynamic conditions, such as combat maneuvering of a fighter aircraft. Examination of the INS linearized error dynamics eigenvalue migrations during various dynamic maneuvers reveals significantly stronger instability than the classical vertical channel instability. The Global Positioning System (GPS) offers high accuracy navigation performance benefits with global coverage, but it has limitations during the dynamic maneuvering of fighter aircraft. The optimal integration of the GPS with an INS promises synergistic system performance benefits not realizable with either system individually. A candidate maneuver is selected for which a covariance analysis is performed to demonstrate the performance characteristics of an optimally integrated INS/GPS system. Significant insight into the potential instability of a particular INS/GPS integration scheme is presented. The characteristic and unstable behavior of the INS error dynamics eigenfunctions provides the basis for the 'filter-driving-filter' performance analysis. Several phenomena were observed which should aid future efforts attempting to characterize the performance of various INS/GPS integration methods. Author

##### **INDEPENDENT ORBITER ASSESSMENT (IOA): ANALYSIS OF THE DISPLAYS AND CONTROLS SUBSYSTEM**

W. H. TRAHAN and E. E. PRUST 1 Dec. 1987 182 p  
(Contract NAS9-17650)

(NASA-CR-185563; NAS 1.26:185563; REPT-1.0-WP-VA87001-06)  
Avail: NTIS HC A09/MF A01 CSCL 22/2

The results of the Independent Orbiter Assessment (IOA) of the Failure Modes and Effects Analysis (FMEA) and Critical Items List (CIL) are presented. The IOA approach features a top-down analysis of the hardware to determine failure modes, criticality, and potential critical items. To preserve independence, this analysis was accomplished without reliance upon the results contained within the NASA FMEA/CIL documentation. This report documents the independent analysis results corresponding to the Orbiter Displays and Controls (D and C) subsystem hardware. The function of the D and C hardware is to provide the crew with the monitor, command, and control capabilities required for management of all normal and contingency mission and flight operations. The D and C hardware for which failure modes analysis was performed consists of the following: Acceleration Indicator (G-METER); Head Up Display (HUD); Display Driver Unit (DDU); Alpha/Mach Indicator (AMI); Horizontal Situation Indicator (HSI); Attitude Director Indicator

(ADI); Propellant Quantity Indicator (PQI); Surface Position Indicator (SPI); Altitude/Vertical Velocity Indicator (AVVI); Caution and Warning Assembly (CWA); Annunciator Control Assembly (ACA); Event Timer (ET); Mission Timer (MT); Interior Lighting; and Exterior Lighting. Each hardware item was evaluated and analyzed for possible failure modes and effects. Criticality was assigned based upon the severity of the effect for each failure mode. Author

##### **HISTORY OF AIRCRAFT PISTON ENGINE OILS - THE LAST FORTY YEARS**

HERB A. POITZ and WELDON E. GARRELT (Illinois, University, Savoy) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 12 p. refs  
(SAE PAPER 891037) Copyright

An account is given of the development history of piston-engine aviation oils over the last 40 years, which witnessed the transition from straight mineral lubricants to ashless dispersant oils, and then to multiviscosity oils of various compounds (including synthetic-base stocks). The light aircraft industry now has a choice of many excellent oils to choose from. Attention is given to the consequence of the shift in oil container practices, which switched in the mid-1960s from metal quart cans to cardboard-composite cylindrical-wall cans with metal end-caps. All-plastic quart bottles are now widely used. O.C.

##### **STRAIGHT ALCOHOL FUELS FOR GENERAL AVIATION AIRCRAFT**

AUGUSTO M. FERRARA (FAA, Technical Center, Atlantic City, NJ) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 11 p.  
(SAE PAPER 891038) Copyright

The FAA Technical Center has evaluated straight methanol and ethanol fuels using an aircraft fuel system and engine which were installed on a dynamometer. The results of this program identified the conditions which should be used for hot fuel certification. Stoichiometric air-to-fuel ratios were identified as the most likely to result in either detonation or pre-ignition, and some material compatibility and operational problems were noted. The addition of small amounts of denaturing agents did not adversely affect the vapor lock behavior of the fuels. Straight methyl-tertiary-butyl ether was also evaluated. This material's high octane rating, moderate volatility, and relatively high energy density make it an attractive candidate when compared against either ethanol or methanol. Author

##### **BALANCE MODEL OF THE PERFECTLY STIRRED REACTOR WITH THE DISCONTINUITY SURFACE**

S. ZURKOWSKI (Instytut Lotnictwa, Warsaw, Poland) Archivum Combustionis (ISSN 0208-4198), vol. 8, no. 3-4, 1988, p. 331-349. refs

In this paper the system of assumptions to the model of the Perfectly Stirred Reactor (PSR) has been presented. From these assumptions, two models of the PSR arise: the model with a discontinuity surface and the voluminal model. The equivalence of these two models has been demonstrated. The voluminal balances of the total mass of mixture, the mass of reacting component, the kinetic energy, the thermal energy, the overall energy of motion, the internal energy and the total energy for the immobile reactor have been calculated. On the basis of obtained equations some general conclusions concerning the combustion chamber of a jet engine have been reached. It has also been shown how to get the main equations in the Vulis theory of reactors by applying the balances mentioned above. Author

##### **HIGHLY DAMAGE TOLERANT CARBON FIBER EPOXY COMPOSITES FOR PRIMARY AIRCRAFT STRUCTURAL APPLICATIONS**

H. G. RECKER (BASF Structural Materials, Inc., Anaheim, CA), T. ALLSPACH, V. ALTSTADT, T. FOLDA, W. HECKMANN (BASF AG, Ludwigshafen, Federal Republic of Germany) et al. SAMPE Quarterly (ISSN 0036-0821), vol. 21, Oct. 1989, p. 46-51. refs Copyright

Investigations of thermoplastic-modified epoxy neat resins for application in composite prepreg systems exhibiting a significant improvement in fracture toughness and damage tolerance have focused on a deeper understanding, and therefore superior control of morphology within phase-separated systems. A specific morphology has been observed which correlates with a distinct maximum in neat-resin fracture toughness; further understanding of structure-property relationships within laminates has also been used to optimize composite mechanical properties. Highly damage-tolerant systems possessing excellent hot/wet properties and solvent resistance have been thus obtained. O.C.

##### **INTERMETALLIC COMPOUNDS FOR STRONG HIGH-TEMPERATURE MATERIALS - STATUS AND POTENTIAL**

R. L. FLEISCHER (GE Research and Development Center, Schenectady, NY), D. M. DIMIDUK (USAF, Wright-Patterson AFB,

OH), and H. A. LIPSITT (Wright State University, Dayton, OH) IN: Annual review of materials science. Volume 19. Palo Alto, CA, Annual Reviews, Inc., 1989, p. 231-263. refs Copyright

Ordered intermetallics are class compounds presenting unique opportunities for gas turbine hot section component fabrication due to their unusual combinations of lightness and high-temperature strength and/or stiffness. Intermetallics are described as 'ordered' if two or more sublattices are required to describe their atomic structures. The existence of ordered intermetallic compounds arises from the existence of stronger bonds between unlike nearest-neighbor atoms than between like nearest-neighbors. Attention is given to current understanding of Fe<sub>3</sub>Al, Ni<sub>3</sub>Al, Ti<sub>3</sub>Al, Al<sub>3</sub>Ti, FeAl, NiAl, and TiAl intermetallics. The most successful of these materials are still plagued by excessive creep. O.C.

#### A90-15214

##### **THE CREEP BEHAVIOR OF THE Ti3Al ALLOY Ti-24Al-11Nb**

R. W. HAYES (Metals Technology, Inc., Northridge, CA) Scripta Metallurgica (ISSN 0036-9748), vol. 23, Nov. 1989, p. 1931-1936. Research supported by Metals Technology, Inc. Copyright

The objective of the study was to evaluate the steady-state creep behavior of the Ti-24Al-11Nb, an alloy currently considered for air breathing jet engine applications. The tests reported here revealed no surface microcracking in specimens tested in air. The activation energy and stress exponent measured for the alloy indicate that power law creep is operative within the temperature (650-760 C) and stress (69-172.35 MPa) range evaluated. The stress level needed for the onset of power law creep in the alloy is substantially lower than in the case of single-phase Ti<sub>3</sub>Al-based intermetallics. V.L.

**STOCHASTIC PROPAGATION OF AN ARRAY OF PARALLEL CRACKS: EXPLORATORY WORK ON MATRIX FATIGUE DAMAGE IN COMPOSITE LAMINATES**

R. E. WILLIFORD Sep. 1989 37 p  
(Contract DE-AC06-76RL-01830)  
(DE89-017837; PNL-6903) Avail: NTIS HC A03/MF A01

Transverse cracking of polymeric matrix materials is an important fatigue damage mechanism in continuous-fiber composite laminates. The propagation of an array of these cracks is a stochastic problem usually treated by Monte Carlo methods. However, this exploratory work proposes an alternative approach wherein the Monte Carlo method is replaced by a more closed-form recursion relation based on fractional Brownian motion. A fractal scaling equation is also proposed as a substitute for the more empirical Paris equation describing individual crack growth in this approach. Preliminary calculations indicate that the new recursion relation is capable of reproducing the primary features of transverse matrix fatigue cracking behavior. Although not yet fully tested or verified, this recursion relation may eventually be useful for real-time applications such as monitoring damage in aircraft structures.

(NASA-CR-4035; NAS 1.26:4035; LR-31038) Avail: NTIS HC A08/MF A01 CSCL 11/4

A program was performed to develop and demonstrate the impact dynamics and acoustic transmission technology for a composite fuselage which meets the design requirements of a 1990 large transport aircraft without substantial weight and cost penalties. The program developed the analytical methodology for the prediction of acoustic transmission behavior of advanced composite stiffened shell structures. The methodology predicted that the interior noise level in a composite fuselage due to turbulent boundary layer will be less than in a comparable aluminum fuselage. The verification of these analyses will be performed by NASA

Langley Research Center using a composite fuselage shell fabricated by filament winding. The program also developed analytical methodology for the prediction of the impact dynamics behavior of lower fuselage structure constructed with composite materials. Development tests were performed to demonstrate that the composite structure designed to the same operating load requirement can have at least the same energy absorption capability as aluminum structure.

This report summarizes the significant contributions from a research program sponsored at Argonne National Laboratory by the Air Force Wright Aeronautical Laboratories, Advanced Propulsion Division. The objectives of this study were to develop advanced computational techniques and physical models for calculating the multidimensional flow and combustion process in subsonic ramjet and ducted rocket configurations. A number of significant accomplishments were made during the course of this study. These include: (1) development of efficient solution techniques for subsonic, elliptic fluid flows; (2) application and assessment of the two-equation turbulence model to swirling and nonswirling flows in a sudden expansion geometry; and (3) analysis of combustion processes in a prototypical ducted rocket configuration.

**THE PREDICTION OF MIDDLE DISTILLATE FUEL PROPERTIES USING LIQUID CHROMATOGRAPHY-PROTON NUCLEAR MAGNETIC RESONANCE SPECTROSCOPY DATA Final Report, 1987 - 1988**  
MADELINE SWANN Jun. 1989 60 p  
(AD-A211879; BRDEC-2478) Avail: NTIS HC A04/MF A01 CSCL 21/4

The research was initiated to support the Army's capability to identify the components of fuels which contribute to low temperature performance of fuels. It was discovered that various physical properties of middle distillate fuels can be predicted. The

liquid chromatography (LC) H-1 NMR technique was developed to predict physical properties based on chemical structures present in the fuels. The prediction of properties is approached from a group property point of view. In the group property approach, the structure of the molecule is examined for structural features which dictate the physical properties of the compounds. In other words, the physical properties of a molecule or compound are determined by the number of types of chemical groups, i.e., methyl, methylene, methine, etc., present. These LC H-1 NMR predicted property measurements were compared to measurements obtained by the ASTM fuel tests. Most measurements were found to be within experimental error. The research has demonstrated that the LC H-1 NMR approach for measuring various middle distillate fuel properties can be used as an alternative to the ASTM methods of fuel property measurement. GRA

**COMPOSITE MATERIALS FOR FUTURE AEROENGINES**  
G. E. KIRK 4 Jun. 1989 8 p Presented at the ASME Gas Turbine and Aeroengine Congress, Toronto, Ontario, 4-8 Jun. 1989  
(PNR90584; ETN-89-95559) Copyright Avail: NTIS HC A02/MF A01

The need for advances in material and manufacturing technology in order that aeroengines can satisfy future market requirements is stressed. The potential of composite materials to meet the increased requirements is discussed. The use of resin composites and further improvements needed in that technology are summarized. The use of metal and ceramic composites where higher temperature capability is required is discussed. Problems that must be solved before these composites can be used to their full potential with confidence are described. ESA

**THE FUTURE OF NON FERROUS METALS IN AEROSPACE ENGINES**  
P. J. POSTANS and R. H. JEAL 6 Oct. 1988 11 p Presented at Eurometaux, Luxembourg, 5-6 Oct. 1988  
(PNR90572; ETN-89-95554) Copyright Avail: NTIS HC A03/MF A01

Trends in nonferrous metals use in aerospace engines in the past, and future uses of such metals are discussed. Nickel and titanium have played a key role in the continuing improvement of aero engines since the 1940s and 1950s. The 1990s will see these materials being further developed, but they are now approaching the limit of their capabilities. For engines beyond the year 2000, conventional metallic materials will not have sufficient strength, stiffness or temperature capability. The development of reinforced or composite materials with metal, glass or ceramic matrices and concurrent work and appropriate new design and manufacturing technology is called for. ESA

**EXPERIMENTAL AND ANALYTICAL EVALUATION OF DYNAMIC LOAD VIBRATION OF A 2240-KW (3000-HP) ROTORCRAFT TRANSMISSION**

FRED K. CHOY (Akron, University, OH), DENNIS P. TOWNSEND, and FRED B. OSWALD (NASA, Lewis Research Center, Cleveland, OH) Franklin Institute, Journal (ISSN 0016-0032), vol. 326, no. 5, 1989, p. 721-735. Previously announced in STAR as N87-20556. refs  
Copyright

A dynamic analysis of a 2240-kW (3000-hp) helicopter planetary system is presented. Results from both analytical and experimental studies show good correlation in gear-tooth loads. A parametric study indicates that the mesh damping ratio has a significant effect on maximum gear tooth load, stress, and vibration. Correlation with experimental results indicates that the Sun-planet mesh damping ratio can significantly differ from the planet ring mesh damping ratio. A numerical fast Fourier transform (FFT) procedure was applied to examine the mesh load components in the frequency domain and the magnitudes of multiple tooth pass frequencies excited by nonsynchronous meshing of the planets. Effects of tooth-spacing errors and tooth-profile modifications with tip relief are examined. A general discussion of results and correlation with the experimental study are also presented. Author

**NUMERICAL SIMULATION OF VALVELESS PULSED COMBUSTORS**

J. A. OLORUNMAIYE (Ilorin, University, Nigeria) and J. A. C. KENTFIELD (Calgary, University, Canada) Acta Astronautica (ISSN 0094-5765), vol. 19, Aug. 1989, p. 669-679. refs  
(Contract NSERC-A-7928)  
Copyright

The paper describes a mathematical model for simulating the cyclic operation of valveless pulsed combustors. The flows in the inlet and tail pipe were assumed to be one-dimensional while the combustion chamber was treated as a large reservoir with uniform thermodynamic properties. The effects of wall friction, heat transfer, gradual area changes, variable entropy and composition changes due to chemical reaction were included in the modeling. The set of first order quasi-linear hyperbolic partial differential equations describing the inlet and tail pipe flows were solved by a numerical method of characteristics. The results predicted with the model are in good agreement with some experimental results. The model showed that intermittent combustion in the combustion chamber is established through variations in the concentrations of carbon dioxide and oxygen. Lower and upper fuel flow rate extinction limits which have been observed experimentally, were found, from the results of the model, to be due to leanness and richness of the fresh charge in the combustion chamber, respectively. **STRUCTURAL OPTIMIZATION OF LIFTING SURFACES WITH DIVERGENCE AND CONTROL REVERSAL CONSTRAINTS**

K. B. BOWMAN (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH), R. V. GRANDHI (Wright State University, Dayton, OH), and F. E. EASTEP (Dayton, University, OH) Structural Optimization (ISSN 0934-4373), vol. 1, Sept. 1989, p. 153-161. refs

(Contract F33615-88-C-3204)

Copyright

In this paper, the static aeroplastic characteristics, divergence velocity, control effectiveness and lift effectiveness are considered in obtaining an optimum weight structure. Swept wing structures are used with upper and lower skins, spar and rib thicknesses, and spar cap and vertical post cross-sectional area as the design parameters. The aerodynamic strip theory is used to derive the constraint formulations and aerodynamic load matrices. A Sequential Unconstrained Minimization Technique (SUMT) algorithm is used to optimize the wing structure to meet the desired aeroelastic constraints. Author

#### **THE ROLE OF ADAPTIVE ANTENNA SYSTEMS WHEN USED WITH GPS**

ROLF JOHANNESSEN (STC Technology, Ltd., Harlow, England) IN: ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings. Washington, DC, Institute of Navigation, 1989, p. 267-270.

The possible effects of jamming on the operation of the GPS is examined, and possible ways of dealing with this problem are discussed. In particular, it is shown that Controlled Reception Pattern Antennas are capable of greatly increasing the jamming levels for which GPS can be used. Nulls of the order of 40 dB can be generated in high dynamic applications. It is expected that such systems will find increased applications in the air, at sea, and on land. V.L.

#### **SCALING EFFECTS IN THE IMPACT RESPONSE OF GRAPHITE-EPOXY COMPOSITE BEAMS**

KAREN E. JACKSON (NASA, Langley Research Center; U.S. Army, Army Aviation Research and Technology Activity, Hampton, VA) and EDWIN L. FASANELLA (Planning Research Corp., Hampton, VA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 16 p. refs (SAE PAPER 891014) Copyright

In support of crashworthiness studies on composite airframes and substructure, an experimental and analytical study was conducted to characterize size effects in the large deflection response of scale model graphite-epoxy beams subjected to impact. Scale model beams of 1/2, 2/3, 3/4, 5/6, and full scale were constructed of four different laminate stacking sequences including unidirectional, angle ply, cross ply, and quasi-isotropic. The beam specimens were subjected to eccentric axial impact loads which were scaled to provide homologous beam responses. Comparisons of the load and strain time histories between the scale model beams and the prototype should verify the scale law and demonstrate the use of scale model testing for determining impact behavior of composite structures. The nonlinear structural analysis finite element program DYCAST (DYnamic Crash Analysis of STRuctures) was used to model the beam response. DYCAST analysis predictions of beam strain response are compared to experimental data and the results are presented. Author

#### **COMPOSITE DRIVESHAFT DESIGNS**

SERGE ABRATE (Missouri-Rolla, University, Rolla) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 14 p. refs

(SAE PAPER 891031) Copyright

Composite materials are used to design drive shafts when significant weight savings are sought or when traditional materials can not be used. A satisfactory design produces a transmission for which the total weight, including intermediate supports, is minimized, while satisfying several constraints. First, critical speeds of the shaft should lay outside of the range of operating speeds. This condition limits the unsupported length of the shaft and requires the use of intermediate supports. The second constraint is that the shaft should not buckle under the maximum expected torque. Driveshaft design consists of selecting the number of intermediate supports, the shaft diameter, and wall-thickness. With composites, the choice of fibers and fiber orientation are additional variables to be used for optimization. Author

### A90-14347

#### **RESIN TRANSFER MOLDING OF COMPOSITE AIRCRAFT STRUCTURES**

MARK WADSWORTH (Wichita State University, KS) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 12 p.

(SAE PAPER 891042) Copyright

Resin transfer molding (RTM) is a process that has been used for manufacturing fiber-glass parts for many years. Renewed interest in RTM has been stimulated by the need for improved producibility in advanced composite manufacture. Recent developments in resins, reinforcement, and automation have made RTM a viable option for manufacturing aircraft structures. The present studies were undertaken to determine the quality and producibility of structures fabricated with this process. A transparent mold was constructed to allow resin flow visualization and modeling of the relationships between processing variables and molding

success. This paper addresses these issues while reviewing the current state of the art in tool design and RTM processing.

### THE WARPING RESTRAINT EFFECT IN THE CRITICAL AND SUBCRITICAL STATIC AEROELASTIC BEHAVIOR OF SWEEP FORWARD COMPOSITE WING STRUCTURES

L. LIBRESCU and S. THANGJITHAM (Virginia Polytechnic Institute and State University, Blacksburg) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 12 p. refs

(SAE PAPER 891056) Copyright

An exact approach to the aeroelastic spanwise lift distribution and divergence instability of swept (aft and back) uniform composite wing structures is developed in this paper. The approach based on the Laplace transform technique enables one to solve in a unified manner both aeroelastic problems. The analysis encompasses the cases of free and restrained warping models for the wing twist. Numerical results are finally presented to demonstrate the effects played by the fiber orientation, ply lay-up, warping restraint and wing geometry both on the subcritical static aeroelastic response and on the divergence instability of composite swept wings.

### AEROSPACE STRUCTURES SUPPORTABILITY

HOWARD WESLEY SMITH (Kansas, University, Lawrence) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 9 p. refs

(SAE PAPER 891058) Copyright

This paper is about supportability in its general sense, with emphasis on aerospace structures. Reliability and maintainability (R&M) are described and defined from the standpoint of both structural analysis. Accessibility, inspectability, and replaceability are described as design attributes. Reliability and probability of failure are shown to be in the domain of the analysis. Availability and replaceability are traditional logistic responsibilities which are influenced by supportability engineers. The USAF R&M 2000 process is described, and the R&M 1988 Workshop at Wright-Patterson Air Force Base is also included in the description.

### ELECTROCHROMIC WINDOWS - APPLICATIONS FOR AIRCRAFT

CAROLINE S. HARRIS and CHARLES B. GREENBERG (PPG Industries, Inc., Pittsburgh, PA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 6 p. refs (SAE PAPER 891063) Copyright

A transparent, solid-state, electrochromic device is described. It demonstrates deep switching in the near infrared and visible spectral regions and good room temperature cycling stability. The response appears reasonably uniform over a 14 cm x 28 cm area, which gives hope for achieving large parts for cockpit and cabin windows. The reversible darkening of the transparency, controlled by an applied voltage or current, has potential application in aircraft to reduce glare and solar heat load to pilots and passengers. The active material in the device is a thin tungsten oxide film which is incorporated into a complex, multilayered structure, essentially that of a transparent battery. The performance of the window is discussed in terms of its configuration, its similarities with commercial batteries and issues critical to aircraft.

### STRESS-STRAIN ANALYSIS OF STRUCTURAL ELEMENTS OF INCOMPRESSIBLE OR NEARLY INCOMPRESSIBLE MATERIALS BY THE FINITE ELEMENT METHOD [K RASCHETU NAPRIAZHENNO-DEFORMIROVANNOGO SOSTOIANIIA ELEMENTOV KONSTRUKTSII IZ NESZHIMAEMYKH ILI POCHTI NESZHIMAEMYKH MATERIALOV METODOM KONECHNYKH ELEMENTOV]

M. IU. AL'ES, V. K. BULGAKOV, and A. M. LIPANOV Aviatsonnaia Tekhnika (ISSN 0579-2975), no. 3, 1989, p. 10-13. In Russian.

Copyright

An iterative finite element algorithm is proposed for calculating the stress-strain state of structural elements made of incompressible or nearly incompressible materials. The algorithm makes it possible to obtain a stable converging solution for any (physically permissible) value of the Poisson coefficient and to substantially reduce the order of the initial system of finite element equations. To illustrate the efficiency and robustness of the algorithm proposed here, some results of numerical and analytical solutions are presented for a hollow circular cylinder under plane strain conditions.

#### **THERMODYNAMIC CALCULATION OF THE COMPRESSORS OF GAS TURBINE ENGINES AND POWERPLANTS AT HIGH AIR PRESSURES [TERMODINAMICHESKII RASCHET KOMPRESSOROV GAZOTURBINNYKH DVIGATELEI I USTANOVOK PRI VYSOKIKH STEPENIAKH POVYSHENIIA DAVLENIYA VOZDUKHA]**

V. P. DOBRODEEV and A. P. NOSKOV. *Aviatsionnaya Tekhnika* (ISSN 0579-2975), no. 3, 1989, p. 94-96. In Russian. refs Copyright

For compressed air pressures higher than 2-2.5 MPa, it is important that the pressure dependence of the thermodynamic properties of air be taken into account. Here, formulas are presented for calculating the density, enthalpy, entropy, isobaric and isochoric specific heats, isentropic index, and sound velocity with allowance for pressure. The thermodynamic parameters calculated on the basis of these formulas are the same as the values calculated by the exact method for pressures up to 30 MPa and agree with the exact results to within 1 percent at pressures up to 100 MPa. V.L.

#### **THE PROPAGATION OF A NORMAL SHOCK IN A VARYING AREA DUCT**

A. SURESH (Sverdrup Technology, Inc., Middleburg Heights, OH) IN: Recent advances in engineering science; *Proceedings of the A. Cerni Eringen Symposium*, Berkeley, CA, June 20-22, 1988. Berlin and New York, Springer-Verlag, 1989, p. 179-187. refs Copyright

Chisnell's law gives the change in strength of a shock propagating into a varying area duct with gas at rest. This paper presents an extension of this law to the case where an isentropic flow exists ahead of the moving shock wave. Using Whitam's (1958) approach, an analytic expression is derived for the change in strength of the shock wave. When conditions ahead of the shock wave are quiescent, the expression reduces to Chisnell's law. The amplification factor obtained in this case is significantly different from Chisnell's law and changes sign as the flow Mach number ahead of the shock wave goes from subsonic to supersonic. C.D.

#### **CARBON FIBRE COMPOSITE BOLTED JOINTS**

L. A. BURNET (British Aerospace, PLC, Warton, England) IN: Design in composite materials; *Proceedings of the IME Conference*, London, England, Mar. 7, 8, 1989. Bury Saint Edmunds, England, Mechanical Engineering Publications, Ltd., 1989, p. 61-67. Copyright

This paper aims to give an introduction to the design of composite bolted joints at British Aerospace. Basic failure modes and the effects of geometric and lay-up variations are discussed. Codes of design practice to ensure optimum joint design are presented. The most common joint occurring in aircraft structures is a countersunk fastener in single shear. Results from programs investigating the static and fatigue response of such joints as a function of laminate thickness and fastener type are presented. Finally, the two methods of stressing bolted joints under combined loading are discussed. The first method is applied to relatively lightly-loaded joints using small fasteners, e.g. wing skin/spar bolting. The second is applied to highly loaded joints using large fasteners, e.g. wing/fuselage attachment. Author

#### **THE ADVANTAGES OF AUTOMATION IN AEROSPACE PRODUCTION**

G. W. HUGHES (British Aerospace, PLC, Blackburn, England) IN: Design in composite materials; *Proceedings of the IME Conference*, London, England, Mar. 7, 8, 1989. Bury Saint Edmunds, England, Mechanical Engineering Publications, Ltd., 1989, p. 115-118. Copyright

Composite components have been manufactured for aircraft for several years. The main application today is for carbon fiber/epoxy resin composites. In the early days of manufacturing the challenge was to manufacture parts of suitable quality to almost any cost. With increasing production volumes and the increasing pressure on costs of both civil and military aircraft programs the emphasis has shifted significantly to one of minimizing costs. An attractive candidate approach is the introduction of automation. This paper investigates various alternative automation options for manufacturing and concludes that the introduction of some plant can be extremely cost-effective. However, care must be taken as some means of automation on offer are not worthy of investment on purely cost grounds. Author

##### **A MODEL FOR THE ELECTROHYDRODYNAMIC FLOW IN A CONSTRICTED ARC HEATER**

KENNETH K. MURAMOTO (Acurex Corp., Mountain View, CA) IN: Heat Transfer and Fluid Mechanics Institute, 31st, Sacramento, CA, June 1, 2, 1989, Proceedings. Sacramento, CA, California State University, 1989, p. 153-173. Research supported by the Acurex Corp. refs  
Copyright

The electrohydrodynamic flow in a constricted arc heater is analyzed using a theoretical model which employs an explicit finite-difference technique for solving the governing conservation equations and auxiliary relations. The numerical procedure consists of a forward-marching process starting from assumed inlet profiles and prescribed wall boundary conditions. The results of the analyses indicate that the exit solution does not depend strongly upon the inlet profiles for constrictors having length-to-diameter ratios greater than 20 and that an increase in turbulent mixing throughout the constrictor results in higher values of the arc voltage and the mass-averaged gas enthalpy at the exit. It is shown that very accurate predictions of overall arc heater performance can be obtained by using a algebraic turbulence model that is a function of the inlet Reynolds number.

##### **THE PRODUCTION OF UNIFORMLY SHEARED STREAMS BY MEANS OF DOUBLE GAUZZES IN WIND TUNNELS - A MATHEMATICAL ANALYSIS**

S. L. V. COELHO (Cambridge, University, England) Experiments in Fluids (ISSN 0723-4864), vol. 8, no. 1-2, Oct. 1989, p. 25-32. Research supported by CNPq. refs  
Copyright

The use of gauzes for the production of uniformly sheared streams in wind tunnels is examined. An analysis of results obtained with single gauzes shows that the poor theoretical evaluations of the shear rate reported in the literature seem to be related to the different empirical expressions for the lift coefficient. Streams with uniform shear rate can only be obtained with single gauzes when high drag screens are used, with the disadvantage of producing large scale turbulent motion downstream from the gauze. As an alternative, a theoretical analysis of the flow through double gauzes of uniform porosity leads to a useful method of designing gauzes for specific shear rates of high intensity. The results of the analysis indicate that the use of a set of several gauzes of low resistance

is an optimal method for producing high shear rates with low turbulence intensities.

##### **COMPLEMENTARY FIELD METHOD FOR INTERFEROMETRIC TOMOGRAPHIC RECONSTRUCTION OF HIGH SPEED AERODYNAMIC FLOWS**

SOYOUNG S. CHA and HONGWEI SUN (Illinois, University, Chicago) Optical Engineering (ISSN 0091-3286), vol. 28, Nov. 1989, p. 1241-1246. Research supported by the U.S. Army. refs  
Copyright

A complementary field method has been devised for interferometric tomographic reconstruction of high-speed aerodynamic flows involving a shock. It is based on the reconstruction of the complementary field, which is the difference between the object field to be reconstructed and its estimate. The method is iterative in nature and incorporates a priori information. This study demonstrates advantages of the method in alleviating the deficiencies associated with computational reconstructors and measured data. Substantial reconstruction improvement is obtained, especially near a shock when its position is utilized as a priori information. Under the test conditions, convergence of the method is rapid.

##### **A NOVEL METHOD OF ATOMIZATION WITH POTENTIAL GAS TURBINE APPLICATIONS**

ARTHUR H. LEFEBVRE (Purdue University, West Lafayette, IN) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 353-361.

In conventional airblast or air-assist nozzles the bulk liquid to be atomized is first transformed into a jet or sheet before being exposed to the atomizing air. In the method of atomization described in this paper, the air is introduced into the bulk liquid at some point upstream of the nozzle discharge orifice. This injected air forms bubbles which 'explode' downstream of the injection orifice thereby shattering the liquid into small drops. Experiments carried out on this atomizer, using water as the working fluid and nitrogen as the driving gas, show that good atomization can be achieved using only small amounts of atomizing gas at injection pressures as low as 173 kPa (25 psi). It is found that atomization quality is largely independent of the size of the nozzle discharge orifice. Thus, the system appears to have good potential for applications where small holes and passages cannot be employed due to the risk of blockage by contaminants in the fuel.

##### **CREEP-FATIGUE INTERACTIONS OF GAS TURBINE MATERIALS**

TARUN GOSWAMI (Gas Turbine Research Establishment, Bangalore, India) Defence Science Journal (ISSN 0011-748X), vol. 38, Oct. 1988, p. 467-475. refs

The military aircraft gas turbine engines are often required to undergo a complex set of operating conditions where the load varies considerably with respect to time. The temperature range for performing such requirements also increases as the thrust increases. The modern design of gas turbine demands very high thrust-to-weight ratio. In order to achieve this, the design is limited in the low-cycle regime. The low-cycle regime necessarily has the plasticity effect because of fatigue and inelastic time-dependent permanent deformation because of creep. Fatigue and creep interaction studies are very important for the safe life design of critical components such as turbine disks and blades.

### **RECENT STUDIES ON THE BEHAVIOUR OF INTERFERENCE FIT PINS IN COMPOSITE PLATES**

T. S. RAMAMURTHY (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) Composite Structures (ISSN 0263-8223), vol. 13, no. 2, 1989, p. 81-99. refs

Copyright

Composites are finding increasing application in many advanced engineering fields like aerospace, marine engineering, hightech sports equipment, etc., due to their high specific strength and/or specific stiffness values. The use of composite components in complex situations like airplane wing root or locations of concentrated load transfer is limited due to the lack of complete understanding of their behavior in the region of joints. Joints are unavoidable in the design and manufacture of complex structures. Pin joints are one of the most commonly used methods of connection. In regions of high stresses like airplane wing root joints, interference fit pins are used to increase its fatigue life and thereby increase the reliability of the whole structure. The present contribution is a study on the behavior of the interference fit pin in a composite plate subjected to both pull and push type of loads. The interference fit pin exhibits partial contact/separation under the loads and the contact region is a nonlinear function of the load magnitude. This nonlinear behavior is studied by adopting the inverse technique and some new results are presented in this paper. Author

### **SHAFT FLEXIBILITY EFFECTS ON AEROELASTIC STABILITY OF A ROTATING BLADED DISK**

NAIM KHADER (Jordan University of Science and Technology, Irbid) and ROBERT LOEWY (Rensselaer Polytechnic Institute, Troy, NY) Journal of Propulsion and Power (ISSN 0748-4658), vol. 5, Nov.-Dec. 1989, p. 718-726. Research supported by Jordan University of Science and Technology. refs (Contract NAG3-37)

Copyright

A comprehensive study of Coriolis forces and shaft flexibility effects on the structural dynamics and aeroelastic stability of a rotating bladed-disk assembly attached to a cantilever, massless, flexible shaft is presented. Analyses were performed for an actual bladed-disk assembly, used as the first stage in the fan of the 'E3' engine. In the structural model, both in-plane and out-of-plane elastic deformation of the bladed-disk assembly were considered relative to their hub, in addition to rigid disk translations and rotations introduced by shaft flexibility. Besides structural coupling between blades (through the flexible disk), additional coupling is introduced through quasisteady aerodynamic loads. Rotational effects are accounted for throughout the work, and some mode shapes for the whole structure are presented at a selected rpm. Author

### **THE MANUFACTURE OF SPF MILITARY AIRCRAFT DOORS IN ALUMINIUM ALLOY**

G. W. HUGHES, S. H. JOHNSTON, and B. GINTY (British

Aerospace, PLC, Aircraft Group, Preston, England) IN: Superplasticity and superplastic forming; Proceedings of the International Conference, Blaine, WA, Aug. 1-4, 1988. Warrendale, PA, Minerals, Metals and Materials Society, 1988, p. 643-648. refs

Copyright

SPF/DB titanium is a proven production technology at BAe. Until recently SPF of aluminium alloys has been confined to secondary and tertiary aircraft structures due to the lack of a suitable structural alloy. Project studies have indicated that useful cost and weight savings can be achieved by the application of SPF aluminium to various military aircraft primary structure components. The development of high strength 7475E and 8090 SPF aluminium alloys offers the potential of manufacturing such structures. The objectives of achieving manufacturing cost savings and weight benefits have been verified through design and manufacture of the L/H module door for Tornado. The subsequent scale-up manufacture of a large complex S shaped SPF 8090 EAP main undercarriage door has also been demonstrated. This paper discusses the manufacture of the Tornado door. Author

**IMPROVING SNOW ROADS AND AIRSTRIPS IN ANTARCTICA Final Report, Nov. 1986 - Jun. 1988**

SUNG M. LEE, WILBUR M. HAAS, ROBERT L. BROWN, and ALBERT F. WUORI Jul. 1989 24 p Sponsored by NSF, Washington, DC  
(AD-A211588; CRREL-SP-89-22) Avail: NTIS HC A02/MF A01 CSCL 08/12

During the 1986 to 1987 austral summer, snow road and runway test lanes were constructed at McMurdo Station and at South Pole Station. These lanes were monitored during Dec. 1986 to Jan. 1987, and again in Jan. 1988. Test sections were constructed of: (1) tractor-compacted snow topped with a 15 cm layer of rotary blower processed snow, (2) rotary processed and compacted snow in 15-cm layers to a depth of 60 cm, (3) rotary processed and compacted snow in 15-cm layers incorporating wood sawdust additive mixed at 5 percent by volume, and (4) rotary-processed snow with 10 percent sawdust by volume. These test sections were monitored by obtaining temperature and density profiles, Rammsonde hardness profiles, California Bearing Ratio and Clegg surface strength values, and testing for ability to withstand traffic. Wood sawdust added to processed snow in amounts of 5 to 10 percent by volume significantly increases the strength of the resulting snow road or runway. Adequate strengths of the snow/sawdust mixtures were achieved for limited use by wheeled C130 aircraft, but additional processing with heat, water or added compaction appears necessary to produce a 25-cm-thick surface layer adequate for frequent use and to accommodate wheeled C141 aircraft. At McMurdo, it was found that the sawdust was not effective in maintaining the integrity of the surface traffic during the thawing season without additional maintenance, whereas at the South Pole, thawing was not a problem since temperatures remained well below the melting point. **ICE RUNWAYS NEAR THE SOUTH POLE Special Report**

CHARLES SWITHINBANK Jun. 1989 47 p  
(Contract MIPR-CRREL-89-12)  
(AD-A211606; CRREL-SR-89-19) Avail: NTIS HC A03/MF A01 CSCL 01/5

Following an examination of air photographs of the Transantarctic Mountains, 37 blue-ice areas were reconnoitered from the air, using a ski-wheel Twin Otter operating from the South Pole. Two sites were selected as potential airfields for conventional transport aircraft, and ground surveys were made. On the Mill Glacier at 85 deg 06'S, 167 deg 15'E there is an area of smooth and level ice which gives a 7-km run directly into the prevailing wind. Five wheel landings were made there. Alongside Mount Howe there is a large area of level ice at 87 deg 20'S, 149 deg 50'W. It offers a 7-km runway, but there is a strong crosswind component from the prevailing wind and some bumps on the ice surface need to be planed off. Eight wheel landings were made at Mount Howe. GRA

**ASR-9 WEATHER CHANNEL TEST REPORT**

DEAN C. PUZZO, SETH W. TROXEL, MARK A. MEISTER, MARK E. WEBER, and JAMES V. PIERONEK 3 May 1989 140 p  
(Contract F19628-85-C-0002; DTFA01-80-Y-10546)  
(AD-A211749; ATC-165; DOT/FAA/PS-89-3) Avail: NTIS HC A07/MF A01 CSCL 17/9

The ASR-9, the next generation airport surveillance radar, will be deployed by the FAA at over 100 locations throughout the U.S. The system includes a weather channel designed to provide ATC personnel with timely and accurate weather reflectivity information as a supplement to normal aircraft information. Issues addressed are: whether the ASR-9 weather channel performs

according to FAA specifications and whether the ASR-9 weather channel adequately represents weather reflectivity for ATC purposes. Comparisons between data from an ASR-9 in Huntsville, AL, recorded during design qualification and testing, and data from two other reference radars, were used as the basis for the assessment. Several storm cases were analyzed, comprised of stratiform rain, isolated convective storms, squall lines, and cold fronts containing multiple simultaneous convective storms. Results suggest that, with the exception of an apparent 3 dB discrepancy between the weather products of the ASR-9 and the reference radars, the ASR-9 weather channel seems to perform according to FAA specifications. Although the ASR-9 products give a reasonable representation of the extent and severity of potentially hazardous weather in Huntsville, the results suggest that the static storm model used to determine beamfill corrections for the ASR-9 should be optimized for the particular climatic region in which an ASR-9 will be operated. **SIMULATION OF GLANCING SHOCK WAVE AND BOUNDARY LAYER INTERACTION**

CHING-MAO HUNG Sep. 1989 13 p Presented at the 8th GAMM Conference, Delft, The Netherlands, 27-29 Sep. 1989  
(NASA-TM-102233; A-89241; NAS 1.15:102233) Avail: NTIS HC A03/MF A01 CSCL 20/4

Shock waves generated by sharp fins, glancing across a laminar boundary layer growing over a flat plate, are simulated numerically. Several basic issues concerning the resultant three-dimensional flow separation are studied. Using the same number of grid points, different grid spacings are employed to investigate the effects of grid resolution on the origin of the line of separation. Various shock strengths (generated by different fin angles) are used to study the so-called separated and unseparated boundary layer and to establish the existence or absence of the secondary separation. The usual interpretations of the flow field from previous studies and new interpretations arising from the present simulation are discussed. Author

**AN INVESTIGATION OF END-WALL VORTEX CAVITATION IN A HIGH REYNOLDS NUMBER AXIAL-FLOW PUMP**

KEVIN J. FARRELL Aug. 1989 182 p Sponsored by Naval Sea Systems Command  
(AD-A211426; ARL/PSU/TR-89-004) Avail: NTIS HC A09/MF A01 CSCL 20/4

Relative motion of a turbomachinery blade row and the casing requires finite clearance between the rotor tips and the end-wall to avoid rubbing. Presence of this gap, relative motion of the blade tip and the end-wall, and pressure difference across the blade give rise to tip clearance flow which causes many adverse effects, including end-wall vortex cavitation. The vortex is formed by interaction of the clearance flow with the through flow on the suction side of the blade. This report formulates a correlation of the appropriate variables which predict the inception of end-wall vortex cavitation using the following approach: (1) identification of necessary parameters and relationships; (2) experimental measurements of the parameters in the High Reynolds Number Pump facility, a 42-inch diameter pump specifically designed for this purpose; (3) formulation of the correlation model from relationships among the measured variables; and (4) verification of the model with existing databases. The resulting model provides guidance to turbomachinery designers. The model of end-wall vortex cavitation successfully correlates the subject data existing databases. An optimum tip clearance was theoretically identified. The correlation model contains the boundary layer, lift coefficient, tip clearance, vortex core size, and tip geometry as input variables. Submodels have been developed for the core radius and tip lift coefficient as a function of tip clearance. Laser velocimeter measurements shown that additional circulation is shed into the tip vortex from the suction side trailing edge. GRA

 Avail: NTIS HC A03/MF A01 CSCL 20/4

An experimental research effort on the subject of swept shock wave interactions with turbulent boundary layers is reported. The research relied largely on nonintrusive, laser based optical flow diagnostics. Experiments were carried out to define the Mach number influence, flowfield structure, and quantitative skin friction behavior of fin generated swept interactions over the supersonic range from Mach 2.5 to 4.0, including weak, moderate, and strong interactions. The results have given new insight into the fin interaction flowfield structure, which involves a jet impingement process caused by shockwave bifurcation. High skin friction levels were measured in the vicinity of this jet impingement and were used for the validation of computational predictions carried out by others. GRA

**IN SERVICE LIFE MONITORING SYSTEM USING G-METER READINGS AND MASS CONFIGURATION CONTROL**

T. GIACOBBE 1987 16 p Presented at the Associazione Italiana per la Fatica in Aeronautica, Milan, Italy, 16-17 Mar. 1987 (ETN-89-95218) Avail: NTIS HC A03/MF A01

The Interim Monitoring System (IMS) is described. This system is based on the g meter readings and allows it to know the fatigue life consumed, before the utilization of the maintenance recorder system. The fatigue life consumption is considerably lower than the theoretical one, if the contractual maneuver spectrum is applied. (The ratio between contractual flight hours and actual flight hours is about 0.25). The results are comparable to those employing Tornado. The usefulness of the system, related to the true life consumption and not to the flight hours, is stressed. ESA

**EFFECT OF CONTROL SURFACE MASS UNBALANCE ON THE STABILITY OF A CLOSED-LOOP ACTIVE CONTROL SYSTEM**

E. NISSIM (Technion - Israel Inst. of Tech., Haifa.) Oct. 1989 26 p  
 (NASA-TP-2952; H-1534; NAS 1.60:2952) Avail: NTIS HC A03/MF A01 CSCL 20/11

The effects on stability of inertial forces arising from closed-loop activation of mass-unbalanced control surfaces are studied analytically using inertial energy approach, similar to the aerodynamic energy approach used for flutter suppression. The

limitations of a single control surface like a leading-edge (LE) control or a trailing-edge (TE) control are demonstrated and compared to the superior combined LE-TE mass unbalanced system. It is shown that a spanwise section for sensor location can be determined which ensures minimum sensitivity to the mode shapes of the aircraft. It is shown that an LE control exhibits compatibility between inertial stabilization and aerodynamic stabilization, and that a TE control lacks such compatibility. The results of the present work should prove valuable, both for the purpose of flutter suppression using mass unbalanced control surfaces, or for the stabilization of structural modes of large space structures by means of inertial forces. **INVESTIGATION OF DIFFICULT COMPONENT EFFECTS ON FINITE ELEMENT MODEL VIBRATION PREDICTION FOR THE BELL AH-1G HELICOPTER. VOLUME 1: GROUND VIBRATION TEST RESULTS**

R. V. DOMPKA Oct. 1989 212 p  
 (Contract NAS1-17496)

(NASA-CR-181916-VOL-1; NAS 1.26:181916-VOL-1) Avail: NTIS HC A10/MF A02 CSCL 20/11

Under the NASA-sponsored Design Analysis Methods for Vibration (DAMVIBS) program, a series of ground vibration tests and NASTRAN finite element model (FEM) correlations were conducted on the Bell AH-1G helicopter gunship to investigate the effects of difficult components on the vibration response of the airframe. Previous correlations of the AH-1G showed good agreement between NASTRAN and tests through 15 to 20 Hz, but poor agreement in the higher frequency range of 20 to 30 Hz. Thus, this effort emphasized the higher frequency airframe vibration response correlations and identified areas that need further F and T work. To conduct the investigations, selected difficult components (main rotor pylon, secondary structure, nonstructural doors/panels, landing gear, engine, fuel, etc.) were systematically removed to quantify their effects on overall vibratory response of the airframe. The entire effort was planned and documented, and the results reviewed by NASA and industry experts in order to ensure scientific control of the testing, analysis, and correlator exercise. In particular, secondary structure and damping had significant effects on the frequency response of the airframe above 15 Hz. Also, the nonlinear effects of thrust stiffening and elastomer mounts were significant on the low frequency pylon modes below main rotor 1p (5.4 Hz). The results of the ground vibration testing are presented. Author

**AVIATION ENGINE TEST FACILITIES (AETF) FIRE**

**PROTECTION STUDY Interim Report, Apr. 1986 - Apr. 1987**

R. C. BELLER, R. E. BURNS (Hughes Associates, Inc., Wheaton MD.), and J. T. LEONARD 13 Jul. 1989 118 p  
 (AD-A211483; NRL-MR-6505) Avail: NTIS HC A06/MF A01 CSCL 01/3

An analysis is presented to the effectiveness of various type:

of fire fighting agents in extinguishing the kinds of fires anticipated in Aviation Engine Test Facilities (AETF), otherwise known as Hush Houses. The agents considered include Aqueous Film-Forming Foam, Halon 1301, Halon 1211 and water. Previous test work has shown the rapidity with which aircraft, especially high performance aircraft, can be damaged by fire. Based on this, tentative criteria for this evaluation included a maximum time of 20 s from fire detection to extinguishment and a period of 30 min in which the agent would prevent reignition. Other issues examined included: toxicity, corrosivity, ease of personnel egress, system reliability, and cost effectiveness. The agents were evaluated for their performance in several fire scenarios, including: under frame fire, major engine fire, engine disintegration fire, high-volume pool fire with simultaneous spill fire, internal electrical fire, and runaway engine fire. **ROLLING OF ARALL LAMINATES (AN ALTERNATIVE METHOD FOR POST-STRETCHING ARALL LAMINATES)**

D. CHEN, F. E. H. M. SMULDERS, and L. B. VOGELSENG  
Jul. 1988 23 p  
(LR-560; ETN-89-95606) Avail: NTIS HC A03/MF A01

A rolling process is presented as an alternative to post stretching aramid reinforced aluminum laminates (ARALL) in order to set fibers under tension and the aluminum layers under compression. It is found that the reversion of the thermal residual stress system in ARALL laminates can easily be achieved by rolling the material to a permanent setting (for instance 0.4 percent). The fatigue properties of the material are as good as the post-stretched version and some of the mechanical properties show significant improvement without losing any advantage. The main advantage of this process is that conventional rolling equipment can be used which means lower costs and higher productivity for the materials manufacturer. The process may be used to treat wide panels which is essential if the ARALL laminates are to be used as aircraft fuselage skin materials. Test results are presented. ESA

An Air Traffic Control (ATC) simulation testbench constructed for the purpose of assessing the use of voice coding equipment (vocoders) for relaying voice communications between air traffic controllers and pilots via satellite digital communication channels is described. The development of the testbench and the analysis procedures is described. Several vocoders employing different coding algorithms which have been proposed for use over satellite data channels are assessed. Within the limitations imposed by the simulation, the assessment suggests that voice coded speech at 8 to 9.6 k bit/sec would be acceptable for some ATC tasks. The assessment results were also used to rank the vocoders for acceptability to support ATC voice communications under various bit error rates over the digital communication channel. ESA

**FINE RESOLUTION ERRORS IN SECONDARY SURVEILLANCE RADAR ALTITUDE REPORTING AMONGST AIRCRAFT TRANSMITTING THE CONSPICUITY CODES 4321 AND 4322**

P. BANKS, B. A. WYNDHAM, and D. B. JENKINS Jun. 1988 13 p Sponsored by the Civil Aviation Authority, London, England

(RSRE-88004; BR108924; ETN-89-94834) Copyright Avail: NTIS HC A03/MF A01

The incidence of Secondary Surveillance Radar (SSR) mode C pressure altitude encoding faults are examined. It is caused by stuck/shorted C bits, investigated amongst aircraft transmitting the SSR mode A conspicuity codes 4321 and 4322. The 6808 aircraft trajectories are studied. The 152 trajectories displayed C bit faults on the SSR mode C replies. The proportion of SSR plots bearing conspicuity codes is found to vary with geographical location and time. The measured frequency for similar mode C faults and the presently measured frequencies of SSR plots mode C faults for conspicuity code aircraft are compared. The results show the overall frequency for stuck/shorted C bit faults ranging 0.49 percent for the airspace covered by the Civil Aviation Authority Heathrow tower radar to 0.70 percent for similar equipment. TNO Physics and Electronics Lab., P.O. Box 96864, 2509 JG The Hague, Netherlands

An aircraft Synthetic Aperture Radar (SAR) simulation program which generates raw data (Sargen) is described. The purpose of the simulation is to investigate the effects of unwanted aircraft motions on SAR imaging. Deliberate maneuvering is not included. Both range and azimuth compressed data are considered. The range compression itself is assumed, not simulated. The azimuth compression, which is needed to form the image is not part of Sargen. The aircraft motion is specified by discrete time sequences of three position and three attitude variables. Validation runs are done, including image formation with existing azimuth compression algorithms. The observed effects corresponded to theoretical approximations. ESA

In order to predict the aerodynamic characteristics of airfoils operating at low Reynolds numbers, it is necessary to accurately account for the effects of laminar (transitional) separation bubbles. Generally, the greatest difficulty comes about when attempting to determine the increase in profile drag that results from the presence of separation bubbles. While a number of empirically based separation bubble models have been introduced in the past, the majority assume that the bubble development is fully predictable from upstream conditions. One way of accounting for laminar separation bubbles in airfoil design is the bubble analog used in the design and analysis program of Eppler and Somers. A locally interactive separation bubble model was developed and incorporated into the Eppler and Somers program. Although unable to account for strong interactions such as the large reduction in suction peak sometimes caused by leading edge bubbles, it is able to predict the increase in drag and the local alteration of the airfoil pressure distribution that is caused by bubbles occurring in the operational range which is of most interest. **SOLUTION OF THE THIN-LAYER NAVIER-STOKES EQUATIONS FOR LAMINAR TRANSONIC FLOW**

TIMO SIIKONEN and JAAKKO HOFFREN 28 Feb. 1989 60 p (PB89-221600; SER-A-89-A11; ISBN-951-754-855-9) Avail: NTIS HC A04/MF A01 CSCL 20/4

A finite-volume-based numerical method for the solution of the thin-layer Navier-Stokes equations is presented. The convective part of the fluxes is solved using a flux-vector splitting method and the diffusive part is solved using central differences. The equations are integrated in time with an approximately factored bidiagonal scheme. Convergence is accelerated by applying a multigrid technique. Results are presented for laminar transonic flows over a NACA 0012 airfoil. GRA

Transition from laminar to turbulent flow at the boundary layer at supersonic speeds is investigated. Techniques of maintaining laminar flow by aspiration are described. Theoretical two dimensional flow models are proposed. Experimental results of airfoil tests are provided. The maintenance of laminar flow by aspiration proves to be much more difficult to achieve in practice than the theoretical model suggests. This is due to the difficulty of determining the speed of flow perpendicular to the airfoil. ESA

(AD-A212377; AFATL-TR-89-19) Avail: NTIS HC A08/MF A01 CSCL 20/4

An efficient scheme for calculating steady and unsteady solutions on blocked grids for several airfoils and wings is presented. Two algorithms are presented, both of which are based on upwind, finite-volume, flux splitting for the convective terms, and an explicit treatment of the diffusive terms. The first algorithm is based on a flux difference split (FDS) scheme. The two algorithms are compared for steady thin-layer Navier-Stokes solutions on a laminar flat plate, RAE 2822 airfoil, and the ONERA M6 wing. The FDS scheme proved to be superior to the FVS in all cases, due to the excessive numerical dissipation in the FVS scheme. A flat plate laminar boundary layer profile is shown with the FDS scheme correctly modeling the boundary layer (compared to a Blasius solution) with only three grid cells internal to the boundary layer; the FVS scheme was not capable of correctly modeling the boundary layer profile. The FDS algorithm was used to evaluate the scheme for unsteady viscous calculations. The diffusive terms are time-lagged in the solution process and therefore are treated as source terms to the convective terms, which behave as a hyperbolic set of equations. The scheme is second order accurate in space and first order accurate in time due to the explicit treatment of the diffusive terms. A Newton subiteration technique was implemented to allow for larger time step sizes and second order temporal accuracy. GRA

Derived from matrix methods of structural analysis and finite element methods developed over the last three decades, computational structures technology (CST) blends computer science, numerical analysis, and approximation theory into structural analysis and synthesis. Recent significant advances in CST include stochastic-based modeling, strategies for performing large-scale structural calculations on new computing systems, and the integration of CST with other disciplinary modules for multidisciplinary analysis and design. New methodologies have been developed at NASA for integrated fluid-thermal structural analysis and integrated aerodynamic-structure-control design. The need for multiple views of data for different modules also led to the development of a number of sophisticated data-base management systems. For CST to play a role in the future development of structures technology and in the multidisciplinary design of future flight vehicles, major advances and computational tools are needed in a number of key areas. (AD-A211918; VLSI-MEMO-89-529) Avail: NTIS HC A05/MF A01 CSCL 12/1

The application of physically based models to sequential optimization was explored and the benefits measured by comparison to optimizations performed using control variable polynomial models. The optimization algorithm developed is based on the sequential use of local (weighted) linear regression models. A new operating point or design is recommended at the optimum of the model within the region where the model is considered valid. This region, within which extrapolations based on the model are believed to be sufficiently accurate, is defined by constraints based on the estimated predictive error of the model and the distance from the data. A new model is created after each data point is collected. As a test case, the sequential optimizer was applied to the design of a paper helicopter for maximum time of flight. The physically based model of the paper helicopter was developed through the use of dimensional analysis, a technique which groups variables according to their dimensions. It was found that the physically based model improved the design of the helicopter more rapidly than the polynomial models. For example, in one comparison of the physical model and the linear model, the physical model reached the optimum design after four sequential designs, while the linear model hadn't reached the optimum after ten designs. **A REVIEW AND UPDATE OF THE NASA AIRCRAFT NOISE PREDICTION PROGRAM PROPELLER ANALYSIS SYSTEM**

ROBERT A. GOLUB (NASA, Langley Research Center, Hampton, VA) and L. CATHY NGUYEN (Planning Research Corp., Hampton, VA) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 14 p. refs (SAE PAPER 891032) Copyright

The National Aeronautics and Space Administration (NASA) Aircraft Noise Prediction Program (ANOPP) Propeller Analysis System (PAS) is a set of computational modules for predicting the aerodynamics, performance, and noise of propellers. The ANOPP PAS has the capability to predict noise levels for propeller aircraft certification and produce parametric scaling laws for the adjustment of measured data to reference conditions. A technical overview of the prediction techniques incorporated into the system is presented. The prediction system has been applied to predict the noise signature of a variety of propeller configurations including the effects of propeller angle of attack. A summary of these validation studies is discussed with emphasis being placed on the wind tunnel and flight test programs sponsored by the Federal Aviation Administration (FAA) for the Piper Cherokee Lance aircraft. A number of modifications and improvements have been made to the system and both DEC VAX and IBM-PC versions of the system have been added to the original CDC NOS version. Author

**BLADE SURFACE PRESSURE MEASUREMENT ON A PUSHER PROPELLER IN FLIGHT**

S. FAROKHI and M. VERTZBERGER (Kansas, University, Lawrence) SAE, General Aviation Aircraft Meeting and Exposition, Wichita, KS, Apr. 11-13, 1989. 12 p. refs (Contract NAG1-867) (SAE PAPER 891040) Copyright

Unsteady aerodynamics of a pusher propeller operating in the wake of a pylon is investigated through analysis of flight test data. Twenty-two surface-mounted miniature pressure transducers were installed at the 75 and 90 percent radius locations on a propeller blade on a test-bed aircraft. Twenty-six different flight conditions were flown to cover the range of speeds, rpm, altitudes, and flap positions encountered by an advanced turboprop general aviation aircraft. Preliminary analysis of the flight test data indicate a strong three-dimensionality to the perturbed flow at the 75 and

90 percent radii due to pylon wake encounter. Time-history of the pressure transducer waveforms recorded for 700 revolutions exhibit a one-per-cycle wave oscillation on the wake signature. No explanation is found for this behavior yet. Author

For a mechanical system consisting of a rigid (main) structure and elastic links with distributed parameters, the problem of the damping of the forced vibrations of the harmonically loaded main structure by means of elastic links is stated and solved. It is shown that the resolvability of the problem depends on the coincidence of one of the natural frequencies of the elastic links with the frequency of the excitation force. The damping of the vibrations of an aircraft wing carrying a pair of elastic elements is analyzed as an example. V.L.

An experimental analysis was made of the noise radiated by a NACA 0012 airfoil in a uniform flow in the CEPRA 19 anechoic wind tunnel. The investigations concerned the estimate of the radiated noise from existing theories developed in particular by Chandiramani, Chase and Howe. They required experimental characterization of the pressure field induced by the turbulent boundary layer in the trailing edge region of the airfoil. This work is original in that it allows the noise to be predicted from wave number spectrum measurements made using a sensor array. The prediction is not limited to low frequencies as is the case for computations using the measured integral scales of Corcos. This approach was also applied to airfoils at an incidence. Author

JOHN W. RAWLS, JR. /n NASA, Langley Research Center, Research in Natural Laminar Flow and Laminar-Flow Control, Part 2 p 617-636 Dec. 1987

Avail: NTIS HC A15/MF A02 CSCL 20/1

The physics of the coupling of sound waves with the boundary layer is not yet well understood. It is believed, however, that for effective coupling of the sound waves and instability waves in the boundary layer, a matching of both frequency and wave number must occur. This requires that the sound field be accurately defined in both space and time. Currently analytical prediction methods lack sufficient accuracy to predict the noise levels from components of a turbofan engine. Although empirical methods do not yield the detail required for an analysis of the receptivity of sound by a boundary layer, valuable insight can be gained as to the changes in noise levels that might be expected under various operating conditions and aircraft configurations. **EFFECTS OF ACOUSTIC SOURCES**

JAMES A. SCHOENSTER and MICHAEL G. JONES (PRC Kentron, Inc., Hampton, VA.) /n *its* Research in Natural Laminar Flow and Laminar-Flow Control, Part 3 p 914-921 Dec. 1987

Avail: NTIS HC A17/MF A03 CSCL 20/1

An experiment was conducted to determine the effect of acoustics on the laminar flow on the side of a nacelle. A flight test was designed to meet this goal and a brief review of the purpose is given. A nacelle with a significant length of laminar flow was mounted on the wing of NASA OV-1. Two noise sources are also mounted on the wing: one in the center body of the nacelle; the second in a wing mounted pod outboard of the nacelle. These two noise sources allow for a limited study of the effect of source direction in addition to control of the acoustic level and frequency. To determine the range of Tollmien-Schlichting frequencies, a stability analysis using the pressure coefficient distribution along the side of the nacelle was performed. Then by applying these frequencies and varying the acoustic level, a study of the receptivity of the boundary layer to the acoustic signal, as determined by the shortening of the length of laminar flow, was conducted. Results are briefly discussed. Author

The measurement and analysis of MD-UHB (McDonnell Douglas Ultra High Bypass) Demonstrator noise and vibration flight test data are described as they relate to passenger cabin noise. The analyses were done to investigate the interior noise characteristics of advanced turboprop aircraft with aft-mounted engines, and to study the effectiveness of selected noise control treatments in reducing passenger cabin noise. The UHB Demonstrator is an MD-80 test aircraft with the left JT8D engine replaced with a prototype UHB engine. For these tests, the UHB engine was a General Electric Unducted Fan, with either 8x8 or 10x8 counter-rotating propeller configurations. Interior noise level characteristics were studied for several altitudes and speeds, with emphasis on high altitude (35,000 ft), high speed (0.75 Mach) cruise conditions. The effectiveness of several noise control treatments was evaluated based on cabin noise measurements. The important airborne and structureborne transmission paths were

identified for both tonal and broadband sources using the results of a sound intensity survey, exterior and interior noise and vibration data, and partial coherence analysis techniques. Estimates of the turbulent boundary layer pressure wavenumber-frequency spectrum were made, based on measured fuselage noise levels. Author

**THE DESIGN AND DEVELOPMENT OF AN ACOUSTIC TEST SECTION FOR THE ARA TRANSONIC WIND TUNNEL**

M. E. WOOD and D. A. NEWMAN 15 Nov. 1988 63 p (PNR90574; INR90259; ETN-89-95555) Copyright Avail: NTIS HC A04/MF A01

The structural, aerodynamic and acoustic design of a lined test section necessary to produce a sufficiently reflection-free environment for noise tests in the Aircraft Research Association (ARA) tunnel at Mach numbers up to 0.85 are described. The aerodynamic design was aided by computational fluid dynamics methods and the acoustic design by a ray-theory model. Results of the aerodynamic calibration of the liner and preliminary acoustic and performance tests on two model propellers are presented. Development work carried out to improve the liner acoustically and aerodynamically is described. ESA

**THE COMMERCIAL AIRCRAFT NOISE PROBLEM**

M. J. T. SMITH 15 Jan. 1989 11 p Presented at the Interdependenzen von Luftfahrt-Staedtebau-Umwelt, Fed. Republic of Germany, Jan. 1988

(PNR90577; ETN-89-95557) Copyright Avail: NTIS HC A03/MF A01

The history and future developments of commercial aircraft noise are discussed. The use of the turbofan engine to replace the louder turbojet engine is identified as a step forward in reducing noise. The increasing use of two engine planes for medium and even long hauls is seen as a positive trend. An increase in the number of aircraft movements is predicted. An upturn in noise exposure around the end of the century is predicted. The development goals of Rolls Royce in meeting the noise reduction challenges of the next decades are discussed. ESA

The work performed in support of the EPA/DOE MADS (Mesoscale Acid Deposition) Project included the development of meteorological data bases for the initialization of chemistry models, the testing and implementation of new planetary boundary layer parameterization schemes in the MASS model, the simulation of transport and precipitation for MADS case studies employing the MASS model, and the use of the TASS model in the simulation

of cloud statistics and the complex transport of conservative tracers within simulated cumuloform clouds. The work performed in support of the NASA/FAA Wind Shear Program included the use of the TASS model in the simulation of the dynamical processes within convective cloud systems, the analyses of the sensitivity of microburst intensity and general characteristics as a function of the atmospheric environment within which they are formed, comparisons of TASS model microburst simulation results to observed data sets, and the generation of simulated wind shear data bases for use by the aviation meteorological community in the evaluation of flight hazards caused by microbursts. **ROTORCRAFT LOW ALTITUDE CNS BENEFIT/COST ANALYSIS: ROTORCRAFT OPERATIONS DATA Final Report**  
BRIAN E. MEE, DEBORAH PEISEN, and MARGARET B. RENTON Sep. 1989 160 p  
(Contract DTFA01-87-C-00014)  
(DOT/FAA/DS-89/9; SCT-89RR-47) Avail: NTIS HC A08/MF A01

Communications, navigation, and surveillance (CNS) services are readily available at the altitudes flown by most fixed wing aircraft. They are not, however, always available at the lower altitudes at which most rotary wing aircraft operate. The objective is to determine if there is an economic basis for improvement of these low altitude CNS services within the National Airspace System (NAS) in order to better support rotorcraft operations. The Rotorcraft Master Plan advocates the establishment of additional CNS facilities as well as the analysis and development of systems to satisfy the increasing demand for widespread IFR rotorcraft operations within the NAS. The findings will aid the FAA decisionmaking in that regard. In view of prior implementation decisions on Loran-C, the emphasis is on communications and surveillance. Background data is provided on the rotorcraft industry as it exists today, as well as forecasts to the year 2007 for the purpose of providing operational data for analysis of long term CNS benefits and costs. Rotorcraft missions are described; those most likely to benefit from increased availability of CNS services are selected; the probability is identified of various combinations within selected rotorcraft operating areas; and an inventory is presented of rotorcraft activity by mission and location. **'BLACK BETSY' - THE 6000C-4 ROCKET ENGINE, 1945-1989.** I FRANK H. WINTER IAF, International Astronautical Congress, 40th, Malaga, Spain, Oct. 7-13, 1989. 41 p. refs  
(IAF PAPER 89-726)

The rocket powerplant used by the sound barrier-breaking X-1 aircraft in 1947, designated 6000C-4 but popularly known as the 'Black Betsy', is presently shown to have proceeded on a career spanning 45 years. After powering a dozen additional experimental aircraft for high speed research, an uprated version of the 6000C-4 served as the engine for the MX-774 test missile that was a precursor to the Atlas ICBM. A pair of the standard 6000C-4 constituted the interim powerplant for the X-15 hypersonic research vehicle prior to the XLR-99 rocket engine's development; in the 1970s, Black Betsies furnished propulsion for various 'lifting body' research vehicles. O.C.

A development history is presented for the emergence of supersonic combustion ramjet, or 'scramjet' concepts from ramjet research, with emphasis on the extent to which military interest and funding has paced and sometimes retarded this avenue of advanced propulsion research. Scramjets are able to generate thrust efficiently at speeds above Mach 5, and perhaps as high as the Mach 25 required (at extreme altitudes) to enter earth orbit. Scramjets typically use liquid hydrogen fuel, which is uniquely capable of diffusing into their supersonic internal flow and combusting at comparable speeds. O.C.

## Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of document content, a title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## AIRFOILS

The effect of trailing edge extensions on the performance of the Goettingen 797 and the Wortmann FX 63-137 aerofoil section at Reynolds numbers between  $3 \times 10^6$  to the 5th and  $1 \times 10^6$  to the 6th

p 82 A90-13783

Computation of flow over airfoils under high lift separated flow condition

p 86 A90-15741

The structure of separated flow regions occurring near the leading edge of airfoils - including transition

[NASA-CR-185853] p 87 N90-11695

Goertler instability on an airfoil

p 91 N90-12517

The design of an airfoil for a high-altitude, long-endurance remotely piloted vehicle

p 104 N90-12545

Studies of gas turbine heat transfer airfoil surfaces and end-wall cooling effects

[AD-A212451] p 117 N90-12620

## AIRFRAMES

Airframe structural design: Practical design information and data on aircraft structures --- Book

p 103 A90-16624

Airframe structural dynamic considerations in rotor design optimization

[NASA-TM-101646] p 134 N90-12057

Investigation of difficult component effects on finite element model vibration prediction for the Bell AH-1G helicopter. Volume 1: Ground vibration test results

[NASA-CR-181916-VOL-1] p 134 N90-12058

Airframe design considerations: Overview --- rotor design optimization

p 106 N90-12586

## AIRPORT PLANNING

Development and evaluation at ATCEU of executive and support operations, phase 4A/3D --- ATCEU (Air Traffic Control Evaluation Unit)

[CAA-PAPER-88017] p 99 N90-12572

## AIRPORT TOWERS

FAA air traffic activity: Fiscal year 1988

[AD-A211338] p 99 N90-12570

## AIRPORTS

The FAA technical classification of aircraft and airports

p 96 A90-15876

A simulation study of landing time allocation procedures for use in computer-assisted air traffic management systems

[AD-A212159] p 99 N90-11722

Development and evaluation at ATCEU of executive and support operations, phase 4A/3D --- ATCEU (Air Traffic Control Evaluation Unit)

[CAA-PAPER-88017] p 99 N90-12572

## ALGORITHMS

On the generation of a variable structure airport surface traffic control system

[AD-A211306] p 99 N90-11724

Sequential design of experiments with physically based models 23

[AD-A211918] p 138 N90-12239

Chordwise loading and camber for two-dimensional thin sections

[AD-A213318] p 95 N90-12568

Automatic processing of images from the GRATE flight test tool

[DLR-FB-89-28] p 109 N90-12599

## ALLOCATIONS

A simulation study of landing time allocation procedures for use in computer-assisted air traffic management systems

[AD-A212159] p 99 N90-11722

## ALTIMETERS

The accuracy of barometric altimeters with respect to geometric altitude

p 108 A90-14012

## ALTITUDE CONTROL

On a pitch control law for a constant glide slope through windshears

p 117 A90-13784

## ALUMINUM

Rolling of ARALL laminates (an alternative method for post-stretching ARALL laminates)

[LR-560] p 135 N90-12778

## ALUMINUM ALLOYS

Intermetallic compounds for strong high-temperature materials - Status and potential

p 125 A90-15022

The creep behavior of the Ti3Al alloy Ti-24Al-11Nb

p 125 A90-15214

The manufacture of SPF military aircraft doors in aluminium alloy --- superplastically formed

p 132 A90-16616

Production of Ti6Al4V-components for a new turbo-fan-engine

p 132 A90-16618

Effects of a heat cycle on material strength

[NAL-TM-562] p 113 N90-11737

Aluminium alloy development for aero engines

[PNR90548] p 126 N90-11874

## ANECHOIC CHAMBERS

Airfoil noise in a uniform flow

p 139 A90-16330

## ANGLE OF ATTACK

Spanwise distribution of lift and drag at high angles of attack

[SAE PAPER 891019] p 83 A90-14331

Effect of the angle of attack on the efficiency and thrust ratio of axial-flow microturbines with full admission

p 111 A90-14590

Normal-force-curve and pitching-moment-curve slopes of forebody-cylinder combinations at zero angle of attack for Mach numbers up to 5

[ESDU-89008] p 89 N90-11709

Flutter clearance of the F-18 high-angle-of-attack research vehicle with experimental wingtip instrumentation pods

[NASA-TM-4148] p 103 N90-11732

Prediction of unsteady blade surface pressures on an advanced propeller at an angle of attack

[NASA-TM-102374] p 94 N90-12560

## ANNULAR FLOW

Selection of a suitable combustion system for a small gas turbine engine

p 112 A90-16005

## ANTARCTIC REGIONS

Improving snow roads and airstrips in Antarctica

[AD-A211588] p 133 N90-11907

Ice runways near the South Pole

[AD-A211606] p 133 N90-11908

## ANTENNA DESIGN

The role of adaptive antenna systems when used with GPS

p 128 A90-13995

## APERTURES

Effect of the radial clearance on the efficiency of a partial microturbine

p 111 A90-14586

## APPROACH CONTROL

Operational trial of effect of raising minimum stack level in Heathrow stacks

[CAA-PAPER-89003] p 99 N90-12573

Parallel approach separation and controller performance: A study of the impact of two separation standards

[DOT/FAA/CT-TN89/50] p 99 N90-12574

## ARC HEATING

A model for the electrohydrodynamic flow in a constricted arc heater

p 131 A90-15393

## ARTIFICIAL INTELLIGENCE

Real-time decision making for autonomous flight control

[SAE PAPER 891053] p 118 A90-14355

## ASSESSMENTS

Assessment of voice coders for ATC/pilot voice communications via satellite digital communication channels

[CAA-PAPER-89004] p 135 N90-12807

## ATMOSPHERIC CHEMISTRY

Mesoscale acid deposition modeling studies

[NASA-CR-4262] p 140 N90-13228

## ATMOSPHERIC MODELS

Mesoscale acid deposition modeling studies

[NASA-CR-4262] p 140 N90-13228

## ATMOSPHERIC TURBULENCE

Some implications of the isotropic momentarily frozen assumptions for the SPAN-MAT program

[NASA-CR-181937] p 88 N90-11704

## ATTACK AIRCRAFT

Estimating the relationships between the state of the art of technology and production cost for the US aircraft

[AD-A212127] p 82 N90-12495

Evaluation of a damaged F/A-18 horizontal stabilator

[AD-A212573] p 107 N90-12597

## ATTITUDE CONTROL

Design of attitude and rate command systems for helicopters using eigenstructure assignment

p 118 A90-14729

Low-speed wind-tunnel study of reaction control-jet effectiveness for hover and transition of a STOVL fighter concept

[NASA-TM-4147] p 119 N90-11751

Aircraft SAR simulation Sargen 1.0

[FEL-1989-44] p 135 N90-12823

## AUTOMATIC LANDING CONTROL

Autoland with GPS

p 97 A90-13985

## AUTOMATIC PILOTS

Real-time decision making for autonomous flight control

[SAE PAPER 891053] p 118 A90-14355

Evaluation of the dynamic properties of the auto-pilot servo of a single-rotor helicopter through laboratory testing

p 118 A90-15424

Pilotless airplanes

[AD-A211719] p 103 N90-11734

## AUTOMATION

The advantages of automation in aerospace production

p 130 A90-15357

## AVIONICS

Composite-embedded optical fibers for communication links

p 139 A90-13847

Avionic system based on global navigational satellite system

p 97 A90-13984

Mode S transponders - A new avionics product

[SAE PAPER 891055] p 98 A90-14357

Acquisition and recording an AMX A/C. Aerialia experience and present trends

[ETN-89-95217] p 109 N90-12598

## AXIAL FLOW

Stage effects on stalling and recovery of a high-speed 10-stage axial-flow compressor

p 115 N90-12600

## AXIAL FLOW PUMPS

An investigation of end-wall vortex cavitation in a high Reynolds number axial-flow pump

[AD-A211426] p 133 N90-11982

## AXIAL FLOW TURBINES

Effect of the angle of attack on the efficiency and thrust ratio of axial-flow microturbines with full admission

p 111 A90-14590

## AXISYMMETRIC BODIES

Numerical solution of unsteady Navier-Stokes equations for laminar/turbulent flows past axis-symmetric bodies at angle of attack

p 85 A90-15235

## B

## BALANCE

Effect of control surface mass unbalance on the stability of a closed-loop active control system

[NASA-TP-2952] p 134 N90-12042

## BALL BEARINGS

Endurance of aircraft gas turbine mainshaft ball bearings-analysis using improved fatigue life theory. II - Application to a bearing operating under difficult lubrication conditions

p 128 A90-13845

## BALLOON FLIGHT

Recent results and major activities in the NASA Balloon Program

[IAF PAPER 89-468] p 81 A90-13557

## BALLOON SOUNDING

Recent results and major activities in the NASA Balloon Program

[IAF PAPER 89-468] p 81 A90-13557

## BALLOON-BORNE INSTRUMENTS

Recent results and major activities in the NASA Balloon Program

[IAF PAPER 89-468] p 81 A90-13557

## BAROMETERS

The accuracy of barometric altimeters with respect to geometric altitude

p 108 A90-14012

## BEAMS (SUPPORTS)

Scaling effects in the impact response of graphite-epoxy composite beams

[SAE PAPER 891014] p 128 A90-14326

## BEARINGS

The nature and control of skidding in lightly loaded intershaft bearings

[PNR90591] p 136 N90-12933

## BEECHCRAFT AIRCRAFT

Beech Starship occupant protection evaluation in emergency landing scenario

[SAE PAPER 891015] p 100 A90-14327

Methods of safety analysis for Beech Model 2000 - Starship 1

[SAE PAPER 891064] p 101 A90-14364

## BENDING FATIGUE

An investigation on combined extension and bending of thin sheets with a central crack

[LR-561] p 137 N90-12958

## BLADE TIPS

Dynamic tip clearance measurements in axial flow compressors

[PNR90597] p 116 N90-12612

## BLADE-VORTEX INTERACTION

Review and analysis of the DNW/Model 360 rotor acoustic data base

[NASA-TM-102253] p 81 N90-11692

## BLUFF BODIES

Development of bluff body wake in a longitudinally curved stream

p 86 A90-15745

## BLUNT BODIES

Aerodynamic heating in shock wave/turbulent boundary layer interaction regions induced by blunt fins

p 82 A90-13775

## BODIES OF REVOLUTION

Incompressible flow about ellipsoids of revolution

[REPT-88-02] p 90 N90-11713

## BODY-WING CONFIGURATIONS

Separated flow over slender wing, body and wing-body combination

p 85 A90-15232

## BOLTED JOINTS

Carbon fibre composite bolted joints

p 130 A90-15354

Recent studies on the behaviour of interference fit pins in composite plates

p 132 A90-16320

Structural optimization of lifting surfaces with divergence and control reversal constraints p 127 A90-13770

Effect of control surface mass unbalance on the stability of a closed-loop active control system [NASA-TP-2952] p 134 A90-12042

**CONTROL SYSTEMS DESIGN**

Synthesis of locally optimal aircraft control in the presence of delay p 137 A90-14561

Design of attitude and rate command systems for helicopters using eigenstructure assignment p 118 A90-14729

Literal singular-value-based flight control system design techniques p 118 A90-14747

A simple active controller to suppress helicopter air resonance in hover and forward flight p 119 A90-16521

Applications of flight control system methods to an advanced combat rotorcraft [NASA-TM-101054] p 119 A90-11752

A design procedure for the handling qualities optimization of the X-29A aircraft [NASA-TM-4142] p 119 A90-11753

Robust control design for flight control [AD-A211957] p 119 A90-11756

**CONTROL THEORY**

Parametric synthesis of piecewise constant locally optimal aircraft control under conditions of indeterminacy p 137 A90-14576

Acceleration, gamma, and theta guidance for abort landing in a windshear p 98 A90-14733

Adaptive control law design for model uncertainty compensation [AD-A211712] p 120 A90-11758

**CONTROLLABILITY**

A design procedure for the handling qualities optimization of the X-29A aircraft [NASA-TM-4142] p 119 A90-11753

**COOLING SYSTEMS**

DB/SPF cooler outlet duct for aircraft application p 132 A90-16620

**CORIOLIS EFFECT**

Shaft flexibility effects on aeroelastic stability of a rotating bladed disk p 132 A90-16371

**CORNER FLOW**

Numerical simulation of supersonic and hypersonic turbulent compression corner flows using PNS equations p 85 A90-15242

**CORROSION TESTS**

Coatings for gas turbine compressors [NLR-MP-88045-U] p 115 A90-11750

**COST ANALYSIS**

The manufacture of SPF military aircraft doors in aluminium alloy --- superplastically formed p 132 A90-16616

Rotorcraft low altitude CNS benefit/cost analysis: Rotorcraft operations data [DOT/FAA/DS-89/9] p 141 A90-12406

**COST EFFECTIVENESS**

Generalized relations for estimating the efficiency and basic dimensions of screw pumps and hydraulic turbines of pump units p 111 A90-14583

Designing for reliable and low maintenance cost aero engines [PNR90570] p 115 A90-12604

Aviation Engine Test Facilities (AETF) fire protection study [AD-A211483] p 134 A90-12777

**COST ESTIMATES**

Estimating the relationships between the state of the art of technology and production cost for the US aircraft [AD-A212127] p 82 A90-12495

**CRACK PROPAGATION**

Effects of a heat cycle on material strength [NAL-TM-562] p 113 A90-11737

Stochastic propagation of an array of parallel cracks: Exploratory work on matrix fatigue damage in composite laminates [DE89-017837] p 126 A90-11813

An investigation on combined extension and bending of thin sheets with a central crack [LR-561] p 137 A90-12958

**CRACKS**

Stochastic propagation of an array of parallel cracks: Exploratory work on matrix fatigue damage in composite laminates [DE89-017837] p 126 A90-11813

**CRASH LANDING**

Post crash flight analysis: Visualizing flight recorder data [AD-A212063] p 96 A90-11715

**CRASHWORTHINESS**

Criteria for general aviation fuel systems crashworthiness [SAE PAPER 891016] p 109 A90-14328

Dynamic testing of crashworthy fuel valves [SAE PAPER 891017] p 128 A90-14329

Impact evaluation of composite floor sections [SAE PAPER 891018] p 100 A90-14330

**CREEP PROPERTIES**

Creep-fatigue interactions of gas turbine materials p 131 A90-16011

**CREEP STRENGTH**

The creep behavior of the Ti3Al alloy Ti-24Al-11Nb p 125 A90-15214

Designing turbine blades for fatigue and creep p 112 A90-16007

**CROSS FLOW**

Design and test of an NLF wing glove for the variable-sweep transition flight experiment p 104 A90-12544

The 757 NLF glove flight test results p 104 A90-12546

**CRYOGENIC ROCKET PROPELLANTS**

The cycle evaluation of the advanced LACE performance [IAF PAPER 89-313] p 109 A90-13447

**CRYOGENIC WIND TUNNELS**

Hot-film system for transition detection in cryogenic wind tunnels p 122 A90-12522

Residual interference assessment in adaptive wall wind tunnels [NASA-CR-181896] p 123 A90-12625

## CRYSTAL STRUCTURE

The creep behavior of the Ti3Al alloy Ti-24Al-11Nb  
p 125 A90-15214

## CUMULATIVE DAMAGE

Evaluation of a damaged F/A-18 horizontal stabilizer  
[AD-A212573] p 107 N90-12597

## CYLINDRICAL BODIES

The effect of flow curvature on the aerodynamic characteristics of an ogive-cylinder body  
p 82 A90-13785

Normal-force-curve and pitching-moment-curve slopes of forebody-cylinder combinations at zero angle of attack for Mach numbers up to 5  
[ESDU-89008] p 89 N90-11709

## D

## DAMAGE ASSESSMENT

Enhanced combat damage tolerance/supportability for improved combat sustainability  
[SAE PAPER 891078] p 101 A90-14370

## DATA ACQUISITION

Noise data of four small propeller-driven airplanes  
[PB89-216980] p 139 N90-12291  
Preliminary experience with high response pressure measurements in a multistage, high speed compressor  
[RAE-TM-P-1141] p 117 N90-12619  
A real-time wind model using digital data from aircraft  
[RSRE-MEMO-4309] p 137 N90-13005

## DATA BASES

Review and analysis of the DNW/Model 360 rotor acoustic data base  
[NASA-TM-102253] p 81 N90-11692  
The role of component testing  
[PNR90589] p 115 N90-12608  
Mesoscale acid deposition modeling studies  
[NASA-CR-4262] p 140 N90-13228

## DATA CORRELATION

Wind tunnel testing of high blockage models  
p 121 A90-15743

## DATA PROCESSING

General data processing support from project planning to workshop control  
[MBB-UD-526/88-PUB] p 138 N90-12208

## DATA RECORDING

Acoustic recording systems for use in military aircraft  
[RAE-TM-MM-11] p 140 N90-13207

## DATA SIMULATION

Aircraft SAR simulation Sargen 1.0  
[FEL-1989-44] p 135 N90-12823

## DECCELERATION

An open-loop transient thermodynamic model of the Cougar turbojet  
[AD-A211774] p 114 N90-11745

## DECISION MAKING

On the generation of a variable structure airport surface traffic control system  
[AD-A211306] p 99 N90-11724

## DEICING

Fatigue and electromagnetic interference test for Electro-Impulse De-Icing  
[SAE PAPER 891062] p 100 A90-14362

## DELAMINATING

Experimental study on the buckling and postbuckling of carbon fibre composite panels with and without interply disbands  
p 130 A90-15355

## DELTA WINGS

Computation of transonic separated flow using the Euler equations  
p 85 A90-15233  
Leading edge flap influence on aerodynamic efficiency  
p 85 A90-15240  
Calculation of flow past delta wings in the thin shock layer approximation  
p 86 A90-15624  
Unsteady aerodynamics with applications to flight mechanics  
[AD-A211944] p 89 N90-11706

## DEPOSITION

Mesoscale acid deposition modeling studies  
[NASA-CR-4262] p 140 N90-13228

## DERIVATION

Incompressible flow about ellipsoids of revolution  
[REPT-88-02] p 90 N90-11713

## DESIGN ANALYSIS

Design for maintainability  
[SAE PAPER 891079] p 81 A90-14371  
Smoothing the way to future designs - A new technique for wind-tunnel measurements  
p 121 A90-15873  
Performance and quality of a wing type parachute: Parametric analysis  
[REPT-88-19] p 89 N90-11710  
Development of direct-inverse 3-D methods for applied transonic aerodynamic wing design and analysis  
[NASA-CR-186036] p 103 N90-11733  
Blading design for multi-storage HP compressor  
[PNR90602] p 116 N90-12616

## DHC 2 AIRCRAFT

Stability and control derivatives of the De Havilland DHC-2 BEAVER aircraft  
[PB89-217525] p 119 N90-11754

## DIESEL ENGINES

The variable cycle diesel as an aircraft engine  
[SAE PAPER 891065] p 110 A90-14365

## DIFFERENTIAL INTERFEROMETRY

Remote detection of boundary-layer transition by an optical system  
p 139 N90-12524

## DIFFUSERS

Variable-velocity flow at the initial mixing section in a diffuser channel  
p 84 A90-14563

## DIFFUSION

Some observations on transitory stall in conical diffusers  
[NASA-TM-102387] p 94 N90-12561

## DIFFUSION WELDING

Diffusion bonding aeroengine components  
p 131 A90-16012  
Study on SPF and SPF/DB of the bulk-head structure with nonsymmetric shape  
p 132 A90-16619

## DIGITAL DATA

A real-time wind model using digital data from aircraft  
[RSRE-MEMO-4309] p 137 N90-13005

## DIGITAL SIMULATION

Numerical simulation of supersonic and hypersonic turbulent compression corner flows using PNS equations  
p 85 A90-15242  
Numerical simulation of an impinging jet on a flat plate  
p 86 A90-15821

A robust digital model following controller for helicopters  
[ESA-TT-1041] p 120 N90-12621

## DIGITAL SYSTEMS

Signal processing in a digital GPS receiver  
p 128 A90-14006  
Applications of flight control system methods to an advanced combat rotorcraft  
[NASA-TM-101054] p 119 N90-11752  
Advanced actuation systems development, volume 1  
[AD-A213334] p 121 N90-12624

## DIGITAL TECHNIQUES

Engine controls for the 1990's  
[PNR90546] p 114 N90-11748

## DISCRETE ADDRESS BEACON SYSTEM

Aircraft Reply and Interference Environment Simulator (ARIES) hardware principles of operation. Volume 2: Appendixes  
[DOT/FAA/CT-TN88/4-2] p 135 N90-12781  
Aircraft Reply and Interference Environment Simulator (ARIES) hardware principles of operation, volume 1  
[DOT/FAA/CT-TN88/4-1] p 135 N90-12782

## DISKS (SHAPES)

Studies on supersonic radial flow behavior in disk channel  
p 87 A90-16104

## DISPLAY DEVICES

Design philosophy for a general aviation TCAS display --- Traffic Advisory and Collision Avoidance System  
[SAE PAPER 891052] p 108 A90-14354  
Two effective methods of approach and landing by visual display  
[SAE PAPER 891054] p 108 A90-14356  
Independent Orbiter Assessment (IOA): Analysis of the displays and controls subsystem  
[NASA-CR-185563] p 124 N90-11774  
Integration of a centralized multiplexed control unit into the cockpit of an aircraft  
[F6150-DT410-1-88329] p 120 N90-12622

## DISTRIBUTED PARAMETER SYSTEMS

Dynamic damping of vibrations in mechanical systems by means of elastic links with distributed parameters  
p 139 A90-15568

## DOORS

The manufacture of SPF military aircraft doors in aluminium alloy --- superplastically formed  
p 132 A90-16616

## DOWNWASH

Analysis of heliport environmental data: Indianapolis downtown heliport, Wall Street heliport. Volume 2: Wall Street heliport data plots  
[DOT/FAA/CT-TN87/54-VOL-2] p 121 N90-11761

## DRAG COEFFICIENTS

Calculation of cone drag  
p 84 A90-14579

## DRAG REDUCTION

Advantage Airbus?  
An experimental investigation of helicopter rotor hub fairing drag characteristics  
[NASA-TM-102182] p 88 N90-11701  
Application of sound and temperature to control boundary-layer transition  
p 92 N90-12537  
Design of the low-speed NLF(1)-0414F and the high-speed HSNLF(1)-0213 airfoils with high-lift systems  
p 93 N90-12540

Experimental and numerical analyses of laminar boundary-layer flow stability over an aircraft fuselage forebody  
p 93 N90-12549  
Status report on a natural laminar-flow nacelle flight experiment  
p 105 N90-12550  
Nacelle design  
p 105 N90-12551  
Reduction of turbulent drag: Boundary layer manipulators  
[CERT-RSF-OA-74/2259-AYD] p 136 N90-12889

## DRAINAGE

Analytical and experimental study of runway runoff with wind effects  
[PTI-8948] p 123 N90-12627

## DROPS (LIQUIDS)

A novel method of atomization with potential gas turbine applications  
p 131 A90-16003

## DUCTED FLOW

The propagation of a normal shock in a varying area duct  
p 130 A90-15045  
Development of bluff body wake in a longitudinally curved stream  
p 86 A90-15745

## DUCTED ROCKET ENGINES

Analytical studies of three-dimensional combustion processes  
[AD-A211903] p 126 N90-11837

## DURABILITY

Durability characteristics of the LAK-12 Letuva glider made of composite materials at the stage of certification  
p 102 A90-15560

## DYNAMIC CHARACTERISTICS

Dynamics of aviation gas turbine engines --- Russian book  
p 113 A90-16049

## DYNAMIC CONTROL

Adaptive control law design for model uncertainty compensation  
[AD-A211712] p 120 N90-11758

## DYNAMIC LOADS

Experimental and analytical evaluation of dynamic load vibration of a 2240-kW (3000-hp) rotorcraft transmission  
p 127 A90-13750

## DYNAMIC MODELS

Criteria for evaluating the flight dynamics model of flight simulators  
p 121 A90-15422  
Adaptive control law design for model uncertainty compensation  
[AD-A211712] p 120 N90-11758

## DYNAMIC RESPONSE

Rotor blade dynamic design  
p 106 N90-12583

## DYNAMIC STRUCTURAL ANALYSIS

Dynamic analysis of lifting surfaces of small relative thickness in the case of finite displacements  
p 129 A90-14560  
Airframe structural dynamic considerations in rotor design optimization  
[NASA-TM-101646] p 134 N90-12057  
RAN (Royal Australian Navy) vibration analysis system operator's guide  
[AD-A212441] p 107 N90-12596

## DYNAMIC TESTS

Dynamic testing of crashworthy fuel valves  
[SAE PAPER 891017] p 128 A90-14329  
Evaluation of the dynamic properties of the auto-pilot servo of a single-rotor helicopter through laboratory testing  
p 118 A90-15424

## DYNAMICAL SYSTEMS

Simulation model-building procedure for dynamic systems integration  
p 138 A90-14744  
Dynamic damping of vibrations in mechanical systems by means of elastic links with distributed parameters  
p 139 A90-15568

## E

## ECONOMIC FACTORS

Effect of the angle of attack on the efficiency and thrust ratio of axial-flow microturbines with full admission  
p 111 A90-14590

## EIGENVALUES

Design of attitude and rate command systems for helicopters using eigenstructure assignment  
p 118 A90-14729

## EJECTORS

Investigation of advanced mixer-ejector exhaust system  
[AD-A211943] p 89 N90-11705

## ELASTIC BODIES

Dynamic analysis of lifting surfaces of small relative thickness in the case of finite displacements  
p 129 A90-14560

## ELASTIC DAMPING

Increasing the heat conductivity of elastic damping elements of MR material  
p 102 A90-14580  
Dynamic damping of vibrations in mechanical systems by means of elastic links with distributed parameters  
p 139 A90-15568

**ELECTRIC PULSES**

Fatigue and electromagnetic interference test for Electro-Impulse De-Icing  
[SAE PAPER 891062] p 100 A90-14362

**ELECTRICAL RESISTIVITY**

Effect of pressure on the electrophysical properties of two-phase flows in nozzles p 110 A90-14572

**ELECTROCHROMISM**

Electrochromic windows - Applications for aircraft  
[SAE PAPER 891063] p 129 A90-14363

**ELECTROHYDRODYNAMICS**

A model for the electrohydrodynamic flow in a constricted arc heater p 131 A90-15393

**ELECTROMAGNETIC ABSORPTION**

Electrochromic windows - Applications for aircraft  
[SAE PAPER 891063] p 129 A90-14363

**ELECTROMAGNETIC INTERFERENCE**

The role of adaptive antenna systems when used with GPS p 128 A90-13995

Fatigue and electromagnetic interference test for Electro-Impulse De-Icing  
[SAE PAPER 891062] p 100 A90-14362

**ELECTRONIC CONTROL**

Engine controls for the 1990's  
[PNR90546] p 114 A90-11748

**ELECTRONIC EQUIPMENT**

Numerical simulation of aeroplane response to a lightning injection  
[ETN-89-95271] p 96 A90-11716

**ELLIPSOIDS**

Incompressible flow about ellipsoids of revolution  
[REPT-88-02] p 90 A90-11713

**EMERGENCIES**

Beech Starship occupant protection evaluation in emergency landing scenario  
[SAE PAPER 891015] p 100 A90-14327

**ENERGY METHODS**

A study of the nonlinear deformation of a shell of revolution with a surface bend p 129 A90-14574

**ENGINE AIRFRAME INTEGRATION**

Re-engine with the Rolls-Royce Tay 670, the route to significant noise reduction  
[PNR90585] p 115 A90-12606

**ENGINE CONTROL**

Classification of methods for eliminating surging in gas turbine engines p 111 A90-14591

An open-loop transient thermodynamic model of the Cougar turbojet  
[AD-A211774] p 114 A90-11745

Engine controls for the 1990's  
[PNR90546] p 114 A90-11748

**ENGINE DESIGN**

Development study of air turbo-ramjet for future space plane  
[IAF PAPER 89-311] p 109 A90-13445

The cycle evaluation of the advanced LACE performance  
[IAF PAPER 89-313] p 109 A90-13447

Design and development of the Garrett F109 turbofan engine  
[SAE PAPER 891046] p 109 A90-14350

Garrett TPF351-20 turboprop fan engine development  
[SAE PAPER 891047] p 109 A90-14351

Successful performance development program for the T800-LHT-800 turboshaft engine  
[SAE PAPER 891048] p 110 A90-14352

Simulation of a turbocompound two-stroke diesel engine  
[SAE PAPER 891066] p 110 A90-14366

A minimal permissible radial clearance in a gas turbine p 110 A90-14569

Increasing the heat conductivity of elastic damping elements of MR material p 102 A90-14580

Thermodynamic calculation of the compressors of gas turbine engines and powerplants at high air pressures p 130 A90-14585

SG40 - Rolls-Royce advanced fighter engine demonstrator p 112 A90-16002

Gas turbine engine component development - An integrated approach p 112 A90-16006

Advanced technology in military gas turbine design and manufacture  
[PNR90545] p 114 A90-11747

Engine controls for the 1990's  
[PNR90546] p 114 A90-11748

Future military powerplants --- fighter aircraft engines  
[PNR90554] p 114 A90-11749

A vision of the future: The new engine technology  
[PNR90566] p 115 A90-12603

Designing for reliable and low maintenance cost aero engines  
[PNR90570] p 115 A90-12604

The next generation supersonic transport engine: Critical issues  
[PNR90576] p 115 A90-12605

Material requirements for future aeroengines

[PNR90595] p 116 A90-12610

A computer integrated approach to dimensional inspection  
[PNR90596] p 116 A90-12611

Gas turbine performance analysis  
[PNR90599] p 116 A90-12614

Blading design for multi-storage HP compressor  
[PNR90602] p 116 A90-12616

Composite materials for future aeroengines  
[PNR90584] p 127 A90-12667

The future of non ferrous metals in aerospace engines  
[PNR90572] p 127 A90-12720

The commercial aircraft noise problem  
[PNR90577] p 140 A90-13203

**ENGINE INLETS**

An investigation into the internal heat transfer characteristics of a thermally anti-iced aero-engine intake lipskin p 111 A90-15390

Development of a VSAERO (Vortex Separation Aerodynamics) model of the F/A-18  
[AD-A212442] p 95 A90-12566

**ENGINE MONITORING INSTRUMENTS**

Development of a remaining useful life of a lubricant evaluation technique. III - Cyclic voltammetric methods p 125 A90-15732

Noninterference blade-vibration measurement system for gas turbine engines p 132 A90-16372

**ENGINE NOISE**

Near-field noise predictions of an aircraft in cruise p 140 A90-12538

The 757 NLF glove flight test results p 104 A90-12546

Re-engine with the Rolls-Royce Tay 670, the route to significant noise reduction  
[PNR90585] p 115 A90-12606

The commercial aircraft noise problem  
[PNR90577] p 140 A90-13203

**ENGINE PARTS**

Gas turbine engine component development - An integrated approach p 112 A90-16006

Integrated approach to design and manufacture of gas turbine components based on group theory p 113 A90-16010

Diffusion bonding aeroengine components p 131 A90-16012

Production of Ti6Al4V-components for a new turbo-fan-engine p 132 A90-16618

Effects of a heat cycle on material strength  
[NAL-TM-562] p 113 A90-11737

Advanced technology in military gas turbine design and manufacture  
[PNR90545] p 114 A90-11747

Aluminium alloy development for aero engines  
[PNR90548] p 126 A90-11874

The role of component testing  
[PNR90589] p 115 A90-12608

Real-time simulation of an F110/STOVL turbofan engine  
[NASA-TM-102-09] p 117 A90-12618

**ENGINE TESTS**

Designing the next generation flying test bed  
[SAE PAPER 891049] p 100 A90-14353

Validation of the accelerated equivalent testing of gas turbine engines for multivariant applications p 110 A90-14568

Design of a language for the testing of aircraft engines p 137 A90-14573

The role of component testing  
[PNR90589] p 115 A90-12608

Aviation Engine Test Facilities (AETF) fire protection study  
[AD-A211483] p 134 A90-12777

**ENVIRONMENT EFFECTS**

Coatings for gas turbine compressors  
[NLR-MP-8804-U] p 115 A90-11750

The next generation supersonic transport engine: Critical issues  
[PNR90576] p 115 A90-12605

**ENVIRONMENT SIMULATORS**

Aircraft Reply and Interference Environment Simulator (ARIES) hardware principles of operation. Volume 2: Appendixes  
[DOT/FAA/CT-TN88/4-2] p 135 A90-12781

Aircraft Reply and Interference Environment Simulator (ARIES) hardware principles of operation, volume 1  
[DOT/FAA/CT-TN88/4-1] p 135 A90-12782

**EPOXY MATRIX COMPOSITES**

The advantages of automation in aerospace production p 130 A90-15357

**EQUATIONS OF MOTION**

Stall/spin/flight simulation  
[DOT/FAA/CT-88/28] p 122 A90-11765

**EROSION**

Effect of environmental particles on a radial compressor p 113 A90-16373

**ERROR CORRECTING DEVICES**

Optimal selection of GPS sets to minimize emitter location errors p 97 A90-13992

**ERROR DETECTION CODES**

Fine resolution errors in secondary surveillance radar altitude reporting amongst aircraft transmitting the conspicuity codes 4321 and 4322  
[RSRE-88004] p 135 A90-12816

**ERROR SIGNALS**

Dynamic interaction of separate INS/GPS Kalman filters (Filter-driving - Filter dynamics) p 124 A90-13996

**ETHYL ALCOHOL**

Straight alcohol fuels for general aviation aircraft  
[SAE PAPER 891038] p 124 A90-14344

**EULER EQUATIONS OF MOTION**

Computation of transonic separated flow using the Euler equations p 85 A90-15233

Euler solutions with a multi-block structured code p 86 A90-15739

Numerical simulation of unsteady rotational flow over propan configurations  
[NASA-CR-186037] p 90 A90-12500

Improvements in the formulations and numerical solution of the Euler problem for swept wings  
[RAE-TM-AERO-2139] p 95 A90-12562

Euler equation solutions applied to a helicopter rotor in forward moving flight  
[ONERA-RSF-32/1285-AY-346A] p 107 A90-12592

Multigrid solution method for the Euler equations  
[PB89-219463] p 138 A90-13116

**EUROPEAN AIRBUS**

Advantage Airbus? p 102 A90-15746

**EVALUATION**

Experimental and analytical evaluation of dynamic load vibration of a 2240-kW (3000-hp) rotorcraft transmission p 127 A90-13750

Numerical simulation of aeroplane response to a lightning injection  
[ETN-89-95271] p 96 A90-11716

**EVOLUTION (DEVELOPMENT)**

Evolution of flight commands in Aeritalia design  
[ETN-89-95211] p 120 A90-11759

**EXHAUST EMISSION**

Exhaust emission performance of a vaporizer tube combustor as compared with a single tube combustor p 111 A90-14614

**EXHAUST FLOW SIMULATION**

Steady and unsteady potential flow around thin annular wings and engines with simulation of jet engine flow  
[DFVLR-FB-89-18] p 89 A90-11711

**EXHAUST NOZZLES**

Investigation of advanced mixer-ejector exhaust system  
[AD-A211943] p 89 A90-11705

**EXTRAPOLATION**

Sequential design of experiments with physically based models 23 p 138 A90-12239

**EXTRUDING**

Installation and implementation of an extrusion cell in aircraft industry utilizing group technology  
[SAE PAPER 891025] p 81 A90-14336

**F**

**F-14 AIRCRAFT**

F-14 VSTFE and results of the cleanup flight test program p 105 A90-12547

**F-16 AIRCRAFT**

General Dynamics F-16 p 100 A90-13791

**F-18 AIRCRAFT**

Simulation model-building procedure for dynamic systems integration p 138 A90-14744

Flutter clearance of the F-18 high-angle-of-attack research vehicle with experimental wingtip instrumentation pods  
[NASA-TM-4148] p 103 A90-11732

**F-86 AIRCRAFT**

Scientific justification and development plan for a mid-sized jet research aircraft  
[PB89-208995] p 103 A90-11731

**FAILURE ANALYSIS**

Methods of safety analysis for Beech Model 2000 - Starship 1  
[SAE PAPER 891064] p 101 A90-14364

RAN (Royal Australian Navy) vibration analysis system operator's guide  
[AD-A212441] p 107 A90-12596

The nature and control of skidding in lightly loaded intershaft bearings  
[PNR90591] p 136 A90-12933

**FAILURE MODES**

Carbon fibre composite bolted joints p 130 A90-15354

- Independent Orbiter Assessment (IOA): Analysis of the displays and controls subsystem  
[NASA-CR-185563] p 124 N90-11774
- FAIRINGS**  
An experimental investigation of helicopter rotor hub fairing drag characteristics  
[NASA-TM-102182] p 88 N90-11701
- FATIGUE (MATERIALS)**  
Effects of a heat cycle on material strength  
[NAL-TM-562] p 113 N90-11737  
Stochastic propagation of an array of parallel cracks: Exploratory work on matrix fatigue damage in composite laminates  
[DE89-017837] p 126 N90-11813
- FATIGUE LIFE**  
Endurance of aircraft gas turbine mainshaft ball bearings-analysis using improved fatigue life theory. II - Application to a bearing operating under difficult lubrication conditions  
p 128 A90-13845  
Designing turbine blades for fatigue and creep  
p 112 A90-16007  
In service life monitoring system using g-meter readings and mass configuration control  
[ETN-89-95218] p 134 N90-12035
- FATIGUE TESTS**  
Fatigue and electromagnetic interference test for Electro-Impulse De-Icing  
[SAE PAPER 891062] p 100 A90-14362  
Creep-fatigue interactions of gas turbine materials  
p 131 A90-16011  
Fatigue behavior of specimens under compression load spectra  
[ETN-89-95207] p 137 N90-12954

Design of the low-speed NLF(1)-0414F and the high-speed HSNLF(1)-0213 airfoils with high-lift systems p 93 N90-12540

Wind tunnel results of the low-speed NLF(1)-0414F airfoil p 93 N90-12541

Wind tunnel results of the high-speed NLF(1)-0213 airfoil p 93 N90-12542

Design and test of a natural laminar flow/large Reynolds number airfoil with a high design cruise lift coefficient p 93 N90-12543

The 757 NLF glove flight test results p 104 N90-12546

Nacelle design p 105 N90-12551

Transition in surface boundary layers  
[CERT-RSF-OA-43/5018-AYD] p 136 N90-12897

Unsteady three-dimensional thin-layer Navier Stokes solutions on dynamic blocked grids p 136 N90-12899

[AD-A212377] p 136 N90-12899

## LAMINAR HEAT TRANSFER

Studies of gas turbine heat transfer airfoil surfaces and end-wall cooling effects  
[AD-A212451] p 117 N90-12620

## LAMINATES

Stochastic propagation of an array of parallel cracks: Exploratory work on matrix fatigue damage in composite laminates

[DE89-017837] p 126 N90-11813

Rolling of ARALL laminates (an alternative method for post-stretching ARALL laminates)

[LR-560] p 135 N90-12778

## LANDING GEAR

Dynamic stiffness of a hydraulic damper in the system of a front landing gear strut p 102 A90-14555

## LANDING SITES

Improving snow roads and airstrips in Antarctica  
[AD-A211588] p 133 N90-11907

Ice runways near the South Pole  
[AD-A211606] p 133 N90-11908

## LASER APPLICATIONS

Volumetric analysis by spontaneous Raman diffusion in a supersonic wind tunnel

[ISL-R-109/88] p 95 N90-12564

## LASER DOPPLER VELOCIMETERS

Basic aerodynamic research facility for comparative studies of flow diagnostic techniques p 122 N90-12526

Experimental studies on Goertler vortices p 91 N90-12529

## LASER INTERFEROMETRY

Remote detection of boundary-layer transition by an optical system p 139 N90-12524

## LEADING EDGE FLAPS

Leading edge flap influence on aerodynamic efficiency p 85 A90-15240

## LEADING EDGES

Development of a stall improvement package for the Gulfstream IV

[SAE PAPER 891021] p 83 A90-14333

Investigations of modifications to improve the spin resistance of a high-wing, single-engine, light airplane

[SAE PAPER 891039] p 118 A90-14345

Effect of the inlet diameter and neck edge radius on the flow coefficient of straight-generatrix nozzles p 84 A90-14577

An investigation into the internal heat transfer characteristics of a thermally anti-iced aero-engine intake lipskin p 111 A90-15390

Calculation of flow past delta wings in the thin shock layer approximation p 86 A90-15624

The structure of separated flow regions occurring near the leading edge of airfoils - including transition

[NASA-CR-185853] p 87 N90-11695

The right wing of the LEFT airplane p 91 N90-12510

Performance of laminar-flow leading-edge test articles in cloud encounters p 104 N90-12511

Simulated airline service experience with laminar-flow control leading-edge systems p 104 N90-12512

Experimental and theoretical investigation of boundary-layer instability mechanisms on a swept leading edge at Mach 3.5 p 94 N90-12557

## LIFE CYCLE COSTS

Applied technology in gas turbine aircraft engine development p 112 A90-16001

## LIFT

An analysis of the possibility of using direct control of the lifting force for modifying the flying qualities of aircraft p 118 A90-15423

Wind tunnel results of the low-speed NLF(1)-0414F airfoil p 93 N90-12541

Powered-lift aircraft technology  
[NASA-SP-501] p 107 N90-12589

## LIFT DEVICES

Wind tunnel results of the high-speed NLF(1)-0213 airfoil p 93 N90-12542

## LIFT DRAG RATIO

Spanwise distribution of lift and drag at high angles of attack

[SAE PAPER 891019] p 83 A90-14331

Propeller development for the Rutan Voyager  
[SAE PAPER 891034] p 100 A90-14341

Design and test of a natural laminar flow/large Reynolds number airfoil with a high design cruise lift coefficient p 93 N90-12543

## LIGHT AIRCRAFT

A low cost stall/spin simulator  
[SAE PAPER 891022] p 117 A90-14334

Investigations of modifications to improve the spin resistance of a high-wing, single-engine, light airplane

[SAE PAPER 891039] p 118 A90-14345

Innovation in general aviation p 81 A90-14997

## LIGHT ALLOYS

The evolution of light alloys in the aerospace industry  
[ETN-89-95216] p 126 N90-11872

**LIGHTNING**

Numerical simulation of aeroplane response to a lightning injection  
[ETN-89-95271] p 96 N90-11716

**LINEAR QUADRATIC GAUSSIAN CONTROL**

A simple active controller to suppress helicopter air resonance in hover and forward flight  
p 119 A90-16521

**LINEAR SYSTEMS**

Advanced actuation systems development, volume 1  
[AD-A213334] p 121 N90-12624

**LIQUID AIR CYCLE ENGINES**

The cycle evaluation of the advanced LACE performance  
[IAF PAPER 89-313] p 109 A90-13447

**LIQUID CHROMATOGRAPHY**

The prediction of middle distillate fuel properties using liquid chromatography-proton nuclear magnetic resonance spectroscopy data  
[AD-A211879] p 126 N90-11899

**LOAD DISTRIBUTION (FORCES)**

A new test procedure for a wing made with carbon fiber composites  
[ETN-89-95220] p 126 N90-11820  
Chordwise loading and camber for two-dimensional thin sections  
[AD-A213318] p 95 N90-12568

**LOAD TESTS**

A new test procedure for a wing made with carbon fiber composites  
[ETN-89-95220] p 126 N90-11820

**LOADS (FORCES)**

Fatigue behavior of specimens under compression load spectra  
[ETN-89-95207] p 137 N90-12954

**LORAN C**

Loran-aided GPS integrity p 98 A90-14013

**LOW ALTITUDE**

Rotorcraft low altitude CNS benefit/cost analysis: Rotorcraft operations data  
[DOT/FAA/DS-89/9] p 141 N90-12406

**LOW COST**

A low cost stall/spin simulator  
[SAE PAPER 891022] p 117 A90-14334

**LOW NOISE**

Design and fabrication requirements for low noise supersonic/hypersonic wind tunnels  
p 122 N90-12555

**LOW REYNOLDS NUMBER**

The effect of trailing edge extensions on the performance of the Goettingen 797 and the Wortmann FX 63-137 aerofoil section at Reynolds numbers between 3 x 10 to the 5th and 1 x 10 to the 6th  
p 82 A90-13783

**LOW SPEED WIND TUNNELS**

Comparison of the results of tests on A300 aircraft in the RAE 5 metre and ONERA F1 wind tunnels  
[RAE-TM-AERO-2130] p 122 N90-11768

**LUBRICANT TESTS**

Development of a remaining useful life of a lubricant evaluation technique. III - Cyclic voltammetric methods  
p 125 A90-15732

**LUBRICATING OILS**

History of aircraft piston engine oils - The last forty years  
[SAE PAPER 891037] p 124 A90-14343  
Development of a remaining useful life of a lubricant evaluation technique. III - Cyclic voltammetric methods  
p 125 A90-15732

**LUBRICATION**

Endurance of aircraft gas turbine mainshaft ball bearings-analysis using improved fatigue life theory. II - Application to a bearing operating under difficult lubrication conditions  
p 128 A90-13845

**M****MACH NUMBER**

Normal-force-curve and pitching-moment-curve slopes of forebody-cylinder combinations at zero angle of attack for Mach numbers up to 5  
[ESDU-89008] p 89 N90-11709  
Experimental and theoretical investigation of boundary-layer instability mechanisms on a swept leading edge at Mach 3.5  
p 94 N90-12557  
Transition in surface boundary layers  
[CERT-RSF-OA-43/5018-AYD] p 136 N90-12897

**MAINTAINABILITY**

Designing the V-22 'Osprey' tiltrotor V/Stol aircraft for maintenance and serviceability  
[SAE PAPER 891075] p 101 A90-14369  
Design for maintainability  
[SAE PAPER 891079] p 81 A90-14371  
The RB199: An in-service success  
[PNR90544] p 114 N90-11746

Development and applications of reliability and maintainability design criteria in military aircraft  
[ETN-89-95208] p 107 N90-12591

**MAINTENANCE**

Improving snow roads and airstrips in Antarctica  
[AD-A211518] p 133 N90-11907  
Evaluation of a damaged F/A-18 horizontal stabilator  
[AD-A212573] p 107 N90-12597  
Designing for reliable and low maintenance cost aero engines  
[PNR90570] p 115 N90-12604

**MAN MACHINE SYSTEMS**

Theory for aircraft handling qualities based upon a structural pilot model  
p 118 A90-14730

**MANAGEMENT PLANNING**

Development and evaluation at ATCEU of executive and support operations, phase 4A/3D --- ATCEU (Air Traffic Control Evaluation Unit)  
[CAA-PAPER-88017] p 99 N90-12572

**MANNED SPACECRAFT**

Aerospace structures supportability  
[SAE PAPER 891058] p 129 A90-14360

**MANUFACTURING**

Installation and implementation of an extrusion cell in aircraft industry utilizing group technology  
[SAE PAPER 891025] p 81 A90-14336

**MASS DISTRIBUTION**

Effect of control surface mass unbalance on the stability of a closed-loop active control system  
[NASA-TD-2952] p 134 N90-12042

**MASS TRANSFER**

Studies of gas turbine heat transfer airfoil surfaces and end-wall cooling effects  
[AD-A21451] p 117 N90-12620

**MATHEMATICAL MODELS**

Robust control design for flight control  
[AD-A211957] p 119 N90-11756  
ILS mathematical modeling study of the effects of proposed hangar construction at the Orlando International Airport, Runway 17R, Orlando, Florida  
[DOT/FAA/CT-TN89/52] p 121 N90-11762  
Sequential design of experiments with physically based models 23  
[AD-A21118] p 138 N90-12239  
Euler equation solutions applied to a helicopter rotor in forward moving flight  
[ONERA-RSF-32/1285-AY-346A] p 107 N90-12592  
Aircraft SAR simulation Sargen 1.0  
[FEL-1989-44] p 135 N90-12823  
A computationally efficient modelling of laminar separation bubbles  
[NASA-CR-185854] p 136 N90-12872

**MEASURING INSTRUMENTS**

Devices and procedures for the calibration of sensors and measurement: Systems of the flight test support system ATTAS  
[DFVLR-MITT-89-06] p 134 N90-12007

**MECHANICAL DRIVES**

Composite driveshaft designs  
[SAE PAPER 891031] p 128 A90-14339

**MECHANICAL PROPERTIES**

Material requirements for future aeroengines  
[PNR90595] p 116 N90-12610  
Composite materials for future aeroengines  
[PNR90584] p 127 N90-12667  
Rolling of ARALL laminates (an alternative method for post-stretching ARALL laminates)  
[LR-560] p 135 N90-12778

**MESOSCALE PHENOMENA**

Mesoscale acid deposition modeling studies  
[NASA-CF-4262] p 140 N90-13228

**METAL BONDING**

Diffusion bonding aeroengine components  
p 131 A90-16012

**METAL MATRIX COMPOSITES**

Composite-embedded optical fibers for communication links  
p 139 A90-13847

**METAL WORKING**

Rolling of ARALL laminates (an alternative method for post-stretching ARALL laminates)  
[LR-560] p 135 N90-12778

**METEOROLOGICAL PARAMETERS**

ASR-9 weather channel test report  
[AD-A211749] p 133 N90-11934

**METEOROLOGICAL RADAR**

ASR-9 weather channel test report  
[AD-A211749] p 133 N90-11934

**METEOROLOGICAL RESEARCH AIRCRAFT**

Scientific justification and development plan for a mid-sized jet research aircraft  
[PB89-201995] p 103 N90-11731  
Meeting review: The Second NCAR (National Center for Atmospheric Research) Research Aircraft Fleet Workshop  
[PB89-201901] p 137 N90-12113

**METEOROLOGICAL SERVICES**

ASR-9 weather channel test report  
[AD-A211749] p 133 N90-11934

**METEOROLOGY**

Scientific justification and development plan for a mid-sized jet research aircraft  
[PB89-208995] p 103 N90-11731

**METHYL ALCOHOL**

Straight alcohol fuels for general aviation aircraft  
[SAE PAPER 891038] p 124 A90-14344

**MIDAIR COLLISIONS**

UK airmisses involving commercial air transport, May-August 1988  
[ISSN-0951-6301] p 96 N90-11717  
UK airmisses involving commercial air transport  
[CAA-2/88] p 96 N90-11718

**MILITARY AIRCRAFT**

The manufacture of SPF military aircraft doors in aluminium alloy --- superplastically formed  
p 132 A90-16616

**MILITARY HELICOPTERS**

Applications of flight control system methods to an advanced combat rotorcraft  
[NASA-TM-101054] p 119 N90-11752

**MILITARY TECHNOLOGY**

Integration of GPS with the Carrier Aircraft Inertial Navigation System (CAINS)  
p 97 A90-13990  
The Soviets' French revelation. II - Aircraft  
p 81 A90-14800

Applied technology in gas turbine aircraft engine development  
p 112 A90-16001

XG40 --- Rolls-Royce advanced fighter engine demonstrator  
p 112 A90-16002

Post crash flight analysis: Visualizing flight recorder data  
[AD-A21063] p 96 N90-11715

**MIXERS**

Investigation of advanced mixer-ejector exhaust system  
[AD-A211943] p 89 N90-11705

**MIXING LENGTH FLOW THEORY**

A circular combustor configuration with multiple injection ports for mixing enhancement  
p 130 A90-15389

**MODAL RESPONSE**

Interior noise control of the Saab 340 aircraft  
[SAE PAPER 891080] p 101 A90-14372

**MODELS**

An open-loop transient thermodynamic model of the Cougar turbojet  
[AD-A211774] p 114 N90-11745

Development of a VSAERO (Vortex Separation Aerodynamics) model of the F/A-18  
[AD-A21442] p 95 N90-12566

Studies of gas turbine heat transfer airfoil surfaces and end-wall cooling effects  
[AD-A21451] p 117 N90-12620

The comparison of the airbase simulation models airbase and sustained  
[FEL-1988-66] p 123 N90-12629

**MOLDING MATERIALS**

Resin transfer molding of composite aircraft structures  
[SAE PAPER 891042] p 128 A90-14347

**MOLECULAR STRUCTURE**

The prediction of middle distillate fuel properties using liquid chromatography-proton nuclear magnetic resonance spectroscopy data  
[AD-A211879] p 126 N90-11899

**MOUNTAINS**

Ice runways near the South Pole  
[AD-A211606] p 133 N90-11908

**N****NACELLES**

Status report on a natural laminar-flow nacelle flight experiment  
p 105 N90-12550  
Nacelle design  
p 105 N90-12551  
Nacelle aerodynamic performance  
p 105 N90-12552

Effects of acoustic sources  
p 140 N90-12553

**NASA PROGRAMS**

A review and update of the NASA aircraft noise prediction program propeller analysis system  
[SAE PAPER 891032] p 139 A90-14340  
The NASA experience in aeronautical R and D: Three case studies with analysis  
[AD-A211486] p 82 N90-12496

**NASTRAN**

Investigation of difficult component effects on finite element model vibration prediction for the Bell AH-1G helicopter. Volume 1: Ground vibration test results  
[NASA-CR-181916-VOL-1] p 134 N90-12058

## NATIONAL AIRSPACE SYSTEM

UK airmisses involving commercial air transport, May-August 1988  
[ISSN-0951-6301] p 96 N90-11717  
Rotorcraft low altitude CNS benefit/cost analysis: Rotorcraft operations data  
[DOT/FAA/DS-89/9] p 141 N90-12406

## NATIONAL AIRSPACE UTILIZATION SYSTEM

Operational trial of effect of raising minimum stack level in Heathrow stacks  
[CAA-PAPER-89003] p 99 N90-12573

## NAVIER-STOKES EQUATION

Recent Navier/Stokes calculations in applications  
p 85 A90-15227  
Numerical solution of unsteady Navier-Stokes equations for laminar/turbulent flows past axis-symmetric bodies at angle of attack  
p 85 A90-15235  
Numerical simulation of supersonic and hypersonic turbulent compression corner flows using PNS equations  
p 85 A90-15242  
Convergence properties of high-Reynolds-number separated flow calculations  
p 86 A90-15820  
Computation of the thin-layer Navier-Stokes equations for a 2D flow  
p 87 A90-16332  
Application of sound and temperature to control boundary-layer transition  
p 92 N90-12537  
Solution of the thin-layer Navier-Stokes equations for laminar transonic flow  
[PB89-221600] p 136 N90-12879  
Unsteady three-dimensional thin-layer Navier Stokes solutions on dynamic blocked grids  
[AD-A212377] p 136 N90-12899

## NAVIGATION AIDS

The role of adaptive antenna systems when used with GPS  
p 128 A90-13995  
Integrated navigation system design and performance with Phase III GPS user equipment  
p 98 A90-13997  
Architecture options for GPS/Carousel IV integration  
p 108 A90-13999  
Design philosophy for a general aviation TCAS display --- Traffic Advisory and Collision Avoidance System  
[SAE PAPER 891052] p 108 A90-14354

## NAVIGATION INSTRUMENTS

Architecture options for GPS/Carousel IV integration  
p 108 A90-13999  
Acquisition and recording an AMX A/C. Aeritalia experience and present trends  
[ETN-89-95217] p 109 N90-12598

## NAVIGATION SATELLITES

ION, Satellite Division's International Technical Meeting, Colorado Springs, CO, Sept. 19-23, 1988, Proceedings  
p 123 A90-13976  
International satellite radionavigation and radiolocation - Choosing among the options  
p 96 A90-13979  
Influence of satellite geometry, range, clock, and altimeter errors on two-satellite GPS navigation  
p 123 A90-13993  
Flight demonstration of two and three satellite navigation  
p 98 A90-13994

## NEAR FIELDS

Near-field noise predictions of an aircraft in cruise  
p 140 N90-12538

## NICKEL ALLOYS

Intermetallic compounds for strong high-temperature materials - Status and potential  
p 125 A90-15022

## NIOBIUM ALLOYS

The creep behavior of the Ti3Al alloy Ti-24Al-11Nb  
p 125 A90-15214

## NITROGEN OXIDES

Predicting the CO, HC, and NO(x) emission and combustion efficiency of small turbine engines from the combustion chamber bench test results  
p 125 A90-15425

## NOISE GENERATORS

Effects of acoustic sources  
p 140 N90-12553

## NOISE INTENSITY

Noise data of four small propeller-driven airplanes  
[PB89-216980] p 139 N90-12291

## NOISE MEASUREMENT

The design and development of an acoustic test section for the ARA transonic wind tunnel  
[PNR90574] p 140 N90-13202  
Acoustic recording systems for use in military aircraft  
[RAE-TM-MM-11] p 140 N90-13207

## NOISE PREDICTION

Acoustic design considerations: Review of rotor acoustic sources  
p 106 N90-12585

## NOISE PREDICTION (AIRCRAFT)

A review and update of the NASA aircraft noise prediction program propeller analysis system  
[SAE PAPER 891032] p 139 A90-14340  
Airfoil noise in a uniform flow  
p 139 A90-16330  
Near-field noise predictions of an aircraft in cruise  
p 140 N90-12538

## NOISE REDUCTION

Interior noise control of the Saab 340 aircraft  
[SAE PAPER 891080] p 101 A90-14372  
Beech Starship interior noise experimental studies  
[SAE PAPER 891082] p 101 A90-14374  
Effect of an isolated shell on interior noise levels in a turboprop aircraft  
[SAE PAPER 891083] p 102 A90-14375  
Review and analysis of the DNW/Model 360 rotor acoustic data base  
[NASA-TM-102253] p 81 N90-11692  
Noise data of four small propeller-driven airplanes  
[PB89-216980] p 139 N90-12291  
The NASA experience in aeronautical R and D: Three case studies with analysis  
[AD-A211486] p 82 N90-12496  
What should be done with those noisy old aircraft  
[PNR90562] p 107 N90-12593  
Re-engine with the Rolls-Royce Tay 670, the route to significant noise reduction  
[PNR90585] p 115 N90-12606  
UHB demonstrator interior noise control flight tests and analysis  
[NASA-CR-181897] p 140 N90-13198  
The commercial aircraft noise problem  
[PNR90577] p 140 N90-13203

## NOISE SPECTRA

Effects of acoustic sources  
p 140 N90-12553

## NONFERROUS METALS

The future of non ferrous metals in aerospace engines  
[PNR90572] p 127 N90-12720

## NONLINEAR SYSTEMS

Nonlinear transverse oscillations of a composite dynamic system  
p 129 A90-14558

## NORMAL SHOCK WAVES

The propagation of a normal shock in a varying area duct  
p 130 A90-15045

## NOZZLE FLOW

Development process of turbulence in a round-nozzle air jet  
p 87 A90-16101  
Investigation of advanced mixer-ejector exhaust system  
[AD-A211943] p 89 N90-11705

## NOZZLE GEOMETRY

Effect of the inlet diameter and neck edge radius on the flow coefficient of straight-generatrix nozzles  
p 84 A90-14577  
Development process of turbulence in a round-nozzle air jet  
p 87 A90-16101

## NUMERICAL ANALYSIS

The production of uniformly sheared streams by means of double gauzes in wind tunnels - A mathematical analysis  
p 131 A90-15887  
Computation of ramjet internal flowfields  
[AD-A212001] p 114 N90-11743  
Unsteady three-dimensional thin-layer Navier Stokes solutions on dynamic blocked grids  
[AD-A212377] p 136 N90-12899

## NUMERICAL FLOW VISUALIZATION

Numerical simulation of an impinging jet on a flat plate  
p 86 A90-15821

## NUMERICAL STABILITY

Development of a VSAERO (Vortex Separation Aerodynamics) model of the F/A-18  
[AD-A212442] p 95 N90-12566

## O

## OBSERVATION AIRCRAFT

Pilotless airplanes  
[AD-A211719] p 103 N90-11734

## OGIVES

The effect of flow curvature on the aerodynamic characteristics of an ogive-cylinder body  
p 82 A90-13785  
Unified super/hypersonic similitude for steady and oscillating cones and ogives  
p 82 A90-13786  
Supersonic/hypersonic flow past wedge and plane ogive in oscillation  
p 85 A90-15231  
The determination of the aerodynamic characteristics of an ogive-cylinder body in subsonic, curved, incompressible flow, and an assessment of the effect of flow curvature  
[REPT-87-13] p 89 N90-11712

## OPERATING COSTS

Designing for reliable and low maintenance cost aero engines  
[PNR90570] p 115 N90-12604

## OPERATIONS RESEARCH

The comparison of the airbase simulation models airbase and sustained  
[FEL-1988-66] p 123 N90-12629

## OPERATOR PERFORMANCE

Parallel approach separation and controller performance: A study of the impact of two separation standards  
[DOT/FAA/CT-TN89/50] p 99 N90-12574

## OPTICAL EQUIPMENT

Applications of flight control system methods to an advanced combat rotorcraft  
[NASA-TM-101054] p 119 N90-11752

## OPTICAL FIBERS

Composite-embedded optical fibers for communication links  
p 139 A90-13847

## OPTICAL MEASUREMENT

Remote detection of boundary-layer transition by an optical system  
p 139 N90-12524

## OPTIMAL CONTROL

Synthesis of locally optimal aircraft control in the presence of delay  
p 137 A90-14561  
Parametric synthesis of piecewise constant locally optimal aircraft control under conditions of indeterminacy  
p 137 A90-14576  
Integration of a centralized multiplexed control unit into the cockpit of an aircraft  
[F6150-DT410-1-88329] p 120 N90-12622

## OPTIMIZATION

Structural optimization of lifting surfaces with divergence and control reversal constraints  
p 127 A90-13770  
A design procedure for the handling qualities optimization of the X-29A aircraft  
[NASA-TM-101442] p 119 N90-11753  
Controller design for active vibration suppression of a helicopter  
[DFVLR-FB-89-20] p 120 N90-11760  
Airframe structural dynamic considerations in rotor design optimization  
[NASA-TM-101646] p 134 N90-12057  
Integrated multidisciplinary optimization of rotorcraft: A plan for development  
[NASA-TM-101617] p 106 N90-12580  
General approach and scope --- rotor blade design optimization  
p 106 N90-12581  
Validation of the procedures --- integrated multidisciplinary optimization of rotorcraft  
p 107 N90-12587  
Appendix: Results obtained to date --- integrated multidisciplinary optimization of rotorcraft  
p 107 N90-12588

Reduction of turbulent drag: Boundary layer manipulators  
[CERT-RSF-OA-74/2259-AYD] p 136 N90-12889

## ORIFICES

Effect of the inlet diameter and neck edge radius on the flow coefficient of straight-generatrix nozzles  
p 84 A90-14577

## OSCILLATING FLOW

Unified super/hypersonic similitude for steady and oscillating cones and ogives  
p 82 A90-13786  
Supersonic/hypersonic flow past wedge and plane ogive in oscillation  
p 85 A90-15231  
Experimental study of 2D/3D interactions between a vortical flow and a lifting surface  
p 86 A90-15849

## OSCILLATIONS

Additions and corrections to SUPER: A program for calculating steady and oscillatory supersonic flow over a thin wing, tail plane and fin  
[AD-A211771] p 90 N90-12501

## P

## PARACHUTE DESCENT

Performance and quality of a wing type parachute: Parametric analysis  
[REPT-88-19] p 89 N90-11710

## PARACHUTES

Numerical simulation of three-dimensional flow around parachute canopies  
p 84 A90-14438

## PARAMETERIZATION

Performance and quality of a wing type parachute: Parametric analysis  
[REPT-88-19] p 89 N90-11710

## PARTICLE DENSITY (CONCENTRATION)

Performance of laminar-flow leading-edge test articles in cloud encounters  
p 104 N90-12511

## PARTICULATES

Effect of environmental particles on a radial compressor  
p 113 A90-16373

## PATTERN RECOGNITION

Automatic processing of images from the GRATE flight test tool  
[DLR-FB-89-28] p 109 N90-12599

## PERFORMANCE PREDICTION

An iterative non-linear lifting line model for wings with unsymmetrical stall  
[SAE PAPER 891020] p 83 A90-14332

- Successful performance development program for the T800-LHT-800 turboshaft engine  
[SAE PAPER 891048] p 110 A90-14352
- Simulation of a turbocompound two-stroke diesel engine  
[SAE PAPER 891066] p 110 A90-14366
- Review and analysis of the DNW/Model 360 rotor acoustic data base  
[NASA-TM-102253] p 81 N90-11692
- Some implications of the isotropic momentarily frozen assumptions for the SPAN-MAT program  
[NASA-CR-181937] p 88 N90-11704
- Numerical simulation of unsteady rotational flow over propfan configurations  
[NASA-CR-186037] p 90 N90-12500
- PERFORMANCE TESTS**
- The role of component testing  
[PNR90589] p 115 N90-12608
- PETRI NETS**
- On the generation of a variable structure airport surface traffic control system  
[AD-A211306] p 99 N90-11724

## SPACE NAVIGATION

Accuracy considerations for GPS TSPI system design  
p 98 A90-14001

## SPACE SHUTTLE ORBITERS

Independent Orbiter Assessment (IOA): Analysis of the displays and controls subsystem  
[NASA-CR-185563] p 124 N90-11774

## SPACE TRANSPORTATION

Keepers of the flame --- scramjet development programs p 141 A90-16300

## SPACECRAFT CONTROL

Independent Orbiter Assessment (IOA): Analysis of the displays and controls subsystem  
[NASA-CR-185563] p 124 N90-11774

## SPACECRAFT INSTRUMENTS

Independent Orbiter Assessment (IOA): Analysis of the displays and controls subsystem  
[NASA-CR-185563] p 124 N90-11774

## SPACECRAFT PROPULSION

Preliminary analysis of methodology for assessment of propulsion system for aerospace plane  
[IAF PAPER 89-307] p 123 A90-13442  
Development study of air turbo-ramjet for future space plane  
[IAF PAPER 89-311] p 109 A90-13445

## SPACECRAFT RELIABILITY

Independent Orbiter Assessment (IOA): Analysis of the displays and controls subsystem  
[NASA-CR-185563] p 124 N90-11774

## SPANWISE BLOWING

Spanwise distribution of lift and drag at high angles of attack  
[SAE PAPER 891019] p 83 A90-14331

## SPECIMEN GEOMETRY

Fatigue behavior of specimens under compression load spectra  
[ETN-89-95207] p 137 N90-12954

## SPIN DYNAMICS

Investigations of modifications to improve the spin resistance of a high-wing, single-engine, light airplane  
[SAE PAPER 891039] p 118 A90-14345

## SPIN STABILIZATION

Stall/spin/flight simulation  
[DOT/FAA/CT-88/28] p 122 N90-11765

## SQUEEZE FILMS

Squeeze film damping for aircraft gas turbines  
p 113 A90-16009

## STABILITY DERIVATIVES

Stability and control derivatives of the De Havilland DHC-2 BEAVER aircraft  
[PB89-217525] p 119 N90-11754

## STABILITY TESTS

Performance and quality of a wing type parachute: Parametric analysis  
[REPT-88-19] p 89 N90-11710

## STABILIZERS (FLUID DYNAMICS)

Evaluation of a damaged F/A-18 horizontal stabilizer  
[AD-A212573] p 107 N90-12597

## STATIC PRESSURE

Studies on supersonic radial flow behavior in disk channel  
p 87 A90-16104

## STATIC STABILITY

Structural analysis of the horizontal tail surfaces of subsonic transport aircraft  
p 102 A90-14556

## STATIC TESTS

Large-scale Advanced Prop-fan (LAP) static rotor test report  
[NASA-CR-180848] p 117 N90-12617

## STATICS

ASR-9 weather channel test report  
[AD-A211749] p 133 N90-11934

## STATISTICAL ANALYSIS

A real-time wind model using digital data from aircraft  
[RSRE-MEMO-4309] p 137 N90-13005

## STEADY FLOW

Steady and unsteady potential flow around thin annular wings and engines with simulation of jet engine flow  
[DFVLR-FB-89-18] p 89 N90-11711

Additions and corrections to SUPER: A program for calculating steady and oscillatory supersonic flow over a thin wing, tail plane and fin  
[AD-A211771] p 90 N90-12501

Unsteady three-dimensional thin-layer Navier Stokes solutions on dynamic blocked grids  
[AD-A212377] p 136 N90-12899

## STIRRING

Balance model of the perfectly stirred reactor with the discontinuity surface  
p 125 A90-14652

## STORM SUPPRESSION

ASR-9 weather channel test report  
[AD-A211749] p 133 N90-11934

## STRAIN GAGE BALANCES

Development of a multi-component internal strain-gauge balance for model tests in a cryogenic wind tunnel  
[NLR-TR-88157-U] p 123 N90-12628

## STRAIN GAGES

Development of a multi-component internal strain-gauge balance for model tests in a cryogenic wind tunnel  
[NLR-TR-88157-U] p 123 N90-12628

## STRESS ANALYSIS

Influence of joint fixity on the structural static and dynamic response of a joined-wing aircraft. I - Static response  
[SAE PAPER 891060] p 100 A90-14361

Carbon fibre composite bolted joints  
p 130 A90-15354  
Photoelastic investigation of turbine rotor blade shrouds  
p 112 A90-16008

Rotor blade structural design  
p 106 N90-12584

## STRESS INTENSITY FACTORS

Fatigue behavior of specimens under compression load spectra  
[ETN-89-95207] p 137 N90-12954

## STRESS-STRAIN RELATIONSHIPS

Stress-strain analysis of structural elements of incompressible or nearly incompressible materials by the finite element method  
p 129 A90-14557

## STRUCTURAL ANALYSIS

Integrated multidisciplinary optimization of rotorcraft: A plan for development  
[NASA-TM-101617] p 106 N90-12580

General approach and scope --- rotor blade design optimization  
p 106 N90-12581

Rotor blade aerodynamic design  
p 106 N90-12582

Rotor blade structural design  
p 106 N90-12584

Validation of the procedures --- integrated multidisciplinary optimization of rotorcraft  
p 107 N90-12587

Appendix: Results obtained to date --- integrated multidisciplinary optimization of rotorcraft  
p 107 N90-12588

Evaluation of a damaged F/A-18 horizontal stabilizer  
[AD-A212573] p 107 N90-12597

## STRUCTURAL DESIGN

Computers boost structural technology  
p 138 A90-14799

Carbon fibre composite bolted joints  
p 130 A90-15354

Airframe structural design: Practical design information and data on aircraft structures --- Book  
p 103 A90-16624

Integrated multidisciplinary optimization of rotorcraft: A plan for development  
[NASA-TM-101617] p 106 N90-12580

General approach and scope --- rotor blade design optimization  
p 106 N90-12581

Rotor blade aerodynamic design  
p 106 N90-12582

Rotor blade dynamic design  
p 106 N90-12583

Rotor blade structural design  
p 106 N90-12584

Acoustic design considerations: Review of rotor acoustic sources  
p 106 N90-12585

Airframe design considerations: Overview --- rotor design optimization  
p 106 N90-12586

Appendix: Results obtained to date --- integrated multidisciplinary optimization of rotorcraft  
p 107 N90-12588

## STRUCTURAL DESIGN CRITERIA

Stress-strain analysis of structural elements of incompressible or nearly incompressible materials by the finite element method  
p 129 A90-14557

Development and applications of reliability and maintainability design criteria in military aircraft  
[ETN-89-95208] p 107 N90-12591

Project, implementation, and utilization of composite structures  
[ETN-89-95209] p 127 N90-12665

## STRUCTURAL STABILITY

Development of a VSAERO (Vortex Separation Aerodynamics) model of the F/A-18  
[AD-A212442] p 95 N90-12566

## STRUCTURAL STRAIN

Evaluation of a damaged F/A-18 horizontal stabilizer  
[AD-A212573] p 107 N90-12597

## STRUCTURAL VIBRATION

Nonlinear transverse oscillations of a composite dynamic system  
p 129 A90-14558

Squeeze film damping for aircraft gas turbines  
p 113 A90-16009

Problems related to the acquisition, processing and utilization of the modal parameters measured in flight tests in order to obtain the full envelope for flutter  
[ETN-89-95210] p 103 N90-11735

Investigation of difficult component effects on finite element model vibration prediction for the Bell AH-1G helicopter. Volume 1: Ground vibration test results  
[NASA-CR-181916-VOL-1] p 134 N90-12058

Airframe design considerations: Overview --- rotor design optimization  
p 106 N90-12586

## SUBSONIC AIRCRAFT

Structural analysis of the horizontal tail surfaces of subsonic transport aircraft  
p 102 A90-14556

Lockheed laminar-flow control systems development and applications  
p 90 N90-12506

## SUBSONIC FLOW

Aeroelastic characteristics of wings in subsonic flow  
p 102 A90-14615

Computation of ramjet internal flowfields  
[AD-A212001] p 114 N90-11743

CFD methods for drag prediction and analysis currently in use in UK  
[RAE-TM-AERO-2146] p 95 N90-12563

Multigrid solution method for the Euler equations  
[PB89-219463] p 138 N90-13116

## SUBSONIC WIND TUNNELS

The aerodynamic experimental center of Aeritalia: Combat aircraft group  
[ETN-89-95213] p 122 N90-11766

## SUBSTITUTES

Re-engine with the Rolls-Royce Tay 670, the route to significant noise reduction  
[PNR90585] p 115 N90-12606

## SUPERCRITICAL WINGS

Results of LFC experiment on slotted swept supercritical airfoil in Langley's 8-foot transonic pressure tunnel  
p 92 N90-12531

Boundary-layer stability analysis of Langley Research Center 8-foot LFC experimental data  
p 92 N90-12532

## SUPERPLASTICITY

The manufacture of SPF military aircraft doors in aluminium alloy --- superplastically formed  
p 132 A90-16616

Study on SPF and SPF/DB of the bulk-head structure with nonsymmetric shape  
p 132 A90-16619

DB/SPF cooler outlet duct for aircraft application  
p 132 A90-16620

## SUPERSONIC BOUNDARY LAYERS

Goertler vortices in supersonic and hypersonic boundary layers  
p 83 A90-14091

Supersonic laminar-flow control  
p 93 N90-12554

Supersonic boundary-layer transition on the LaRC F-106 and the DFRF F-15 aircraft. Part 1: Transition measurements and stability analysis  
p 94 N90-12558

Supersonic boundary-layer transition on the LaRC F-106 and the DFRF F-15 aircraft. Part 2: Aerodynamic predictions  
p 94 N90-12559

## SUPERSONIC COMBUSTION

Computation of ramjet internal flowfields  
[AD-A212001] p 114 N90-11743

The next generation supersonic transport engine: Critical issues  
[PNR90576] p 115 N90-12605

## SUPERSONIC COMBUSTION RAMJET ENGINES

Keepers of the flame --- scramjet development programs  
p 141 A90-16300

Computation of ramjet internal flowfields  
[AD-A212001] p 114 N90-11743

## SUPERSONIC COMMERCIAL AIR TRANSPORT

The next generation supersonic transport engine: Critical issues  
[PNR90576] p 115 N90-12605

## SUPERSONIC DRAG

CFD methods for drag prediction and analysis currently in use in UK  
[RAE-TM-AERO-2146] p 95 N90-12563

## SUPERSONIC FLOW

Unified super/hypersonic similitude for steady and oscillating cones and ogives  
p 82 A90-13786

Supersonic/hypersonic flow past wedge and plane ogive in oscillation  
p 85 A90-15231

Numerical simulation of supersonic and hypersonic turbulent compression corner flows using PNS equations  
p 85 A90-15242

Studies on supersonic radial flow behavior in disk channel  
p 87 A90-16104

Additions and corrections to SUPER: A program for calculating steady and oscillatory supersonic flow over a thin wing, tail plane and fin  
[AD-A211771] p 90 N90-12501

The effects of wall surface defects on boundary-layer transition in quiet and noisy supersonic flow  
p 94 N90-12556

Multigrid solution method for the Euler equations  
[PB89-219463] p 138 N90-13116

## SUPERSONIC JET FLOW

A numerical method for calculating supersonic nonisobaric jets  
p 84 A90-14566

## SUPERSONIC WIND TUNNELS

Design and fabrication requirements for low noise supersonic/hypersonic wind tunnels  
p 122 N90-12555

Volumetric analysis by spontaneous Raman diffusion in a supersonic wind tunnel  
[ISL-R-109/88] p 95 N90-12564

## SURFACE COOLING

Studies of gas turbine heat transfer airfoil surfaces and end-wall cooling effects  
[AD-A212451] p 117 N90-12620

## SURFACE DEFECTS

- A study of the nonlinear deformation of a shell of revolution with a surface bend p 129 A90-14574  
The effects of wall surface defects on boundary-layer transition in quiet and noisy supersonic flow p 94 N90-12556

## SURFACE FINISHING

- Design and fabrication requirements for low noise supersonic/hypersonic wind tunnels p 122 N90-12555

## SURFACE GEOMETRY

- The warping restraint effect in the critical and subcritical static aeroelastic behavior of swept forward composite wing structures [SAE PAPER 891056] p 129 A90-14358

## SURFACE NAVIGATION

- GPS: Arrival in the fleet - A GPS AN/SRN-25 receiver assessment p 97 A90-13989

## SURFACE PROPERTIES

- Dynamic analysis of lifting surfaces of small relative thickness in the case of finite displacements p 129 A90-14560  
Balance model of the perfectly stirred reactor with the discontinuity surface p 125 A90-14652

## SURFACE ROUGHNESS EFFECTS

- Effect of the roughness of deposits in a compressor cascade on the flow lag angle p 84 A90-14578  
The effects of wall surface defects on boundary-layer transition in quiet and noisy supersonic flow p 94 N90-12556

## SURGES

- A study on surge and rotating stall in axial compressors - A summary of the measurement and fundamental analysis method p 87 A90-16105

## SURVEILLANCE

- Rotorcraft low altitude CNS benefit/cost analysis: Rotorcraft operations data [DOT/FAA/DS-89/9] p 141 N90-12406

## SURVEILLANCE RADAR

- ASR-9 weather channel test report [AD-A211749] p 133 N90-11934  
Aircraft Reply and Interference Environment Simulator (ARIES) hardware principles of operation. Volume 2: Appendixes [DOT/FAA/CT-TN88/4-2] p 135 N90-12781  
Aircraft Reply and Interference Environment Simulator (ARIES) hardware principles of operation, volume 1 [DOT/FAA/CT-TN88/4-1] p 135 N90-12782  
Fine resolution errors in secondary surveillance radar altitude reporting amongst aircraft transmitting the conspicuity codes 4321 and 4322 [RSRE-88004] p 135 N90-12816

## SURVEYS

- Ice runways near the South Pole [AD-A211606] p 133 N90-11908

## SWEEP EFFECT

- Design of the low-speed NLF(1)-0414F and the high-speed HSNLF(1)-0213 airfoils with high-lift systems p 93 N90-12540  
Experimental and theoretical investigation of boundary-layer instability mechanisms on a swept leading edge at Mach 3.5 p 94 N90-12557

## SWEEP FORWARD WINGS

- The warping restraint effect in the critical and subcritical static aeroelastic behavior of swept forward composite wing structures [SAE PAPER 891056] p 129 A90-14358

## SWEEP WINGS

- Structural optimization of lifting surfaces with divergence and control reversal constraints p 127 A90-13770  
Recent Navier/Stokes calculations in applications p 85 A90-15227  
Boundary-layer stability analysis of Langley Research Center 8-foot LFC experimental data p 92 N90-12532  
Theoretical methods and design studies for NLF and HLFC swept wings at subsonic and supersonic speeds p 92 N90-12535  
Experimental and theoretical investigation of boundary-layer instability mechanisms on a swept leading edge at Mach 3.5 p 94 N90-12557  
Improvements in the formulations and numerical solution of the Euler problem for swept wings [RAE-TM-AERO-2139] p 95 N90-12562

## SYNTHETIC APERTURE RADAR

- Aircraft SAR simulation Sargen 1.0 [FEL-1989-44] p 135 N90-12823

## SYSTEMS ENGINEERING

- Advanced actuation systems development, volume 1 [AD-A213334] p 121 N90-12624

## SYSTEMS INTEGRATION

- Integration of GPS with the Carrier Aircraft Inertial Navigation System (CAINS) p 97 A90-13990  
Simulation model-building procedure for dynamic systems integration p 138 A90-14744

## SYSTEMS SIMULATION

- Simulation model-building procedure for dynamic systems integration p 138 A90-14744

## T

## TAIL ASSEMBLIES

- Additions and corrections to SUPER: A program for calculating steady and oscillatory supersonic flow over a thin wing, tail plane and fin [AD-A211771] p 90 N90-12501

## TAKEOFF

- The 1987 survey of track keeping and altitudes on Heathrow and Gatwick standard instrument departure routes (DAY) [CAA-PAPEFI-88010] p 99 N90-11729

## TARGET DRONE AIRCRAFT

- Pilotless airplanes [AD-A211719] p 103 N90-11734

## TECHNOLOGICAL FORECASTING

- Future military powerplants --- fighter aircraft engines [PNR90554] p 114 N90-11749  
A vision of the future: The new engine technology [PNR90566] p 115 N90-12603  
The next generation supersonic transport engine: Critical issues [PNR90576] p 115 N90-12605  
Material requirements for future aeroengines [PNR90595] p 116 N90-12610  
Composite materials for future aeroengines [PNR90584] p 127 N90-12667  
The future of non ferrous metals in aerospace engines [PNR90572] p 127 N90-12720

## TECHNOLOGY ASSESSMENT

- Innovation in general aviation p 81 A90-14997  
Estimating the relationships between the state of the art of technology and production cost for the US aircraft [AD-A212127] p 82 N90-12495  
LFC: A maturing concept [DOUGLAS-PAPER-7878] p 90 N90-12505

## TECHNOLOGY UTILIZATION

- Holographic head-up displays for air and ground applications p 108 A90-13885

## TEMPERATURE EFFECTS

- Effects of a heat cycle on material strength [NAL-TM-562] p 113 N90-11737  
Application of sound and temperature to control boundary-layer transition p 92 N90-12537

## TENSILE STRENGTH

- Effects of a heat cycle on material strength [NAL-TM-562] p 113 N90-11737

## TERMINAL FACILITIES

- FAA air traffic activity: Fiscal year 1988 [AD-A211338] p 99 N90-12570

## TEST EQUIPMENT

- Designing the next generation flying test bed [SAE PAPER 891049] p 100 A90-14353

## THERMAL CONDUCTIVITY

- Increasing the heat conductivity of elastic damping elements of MR material p 102 A90-14580

## THERMAL EMISSION

- Evaluation of a damaged F/A-18 horizontal stabilizer [AD-A212573] p 107 N90-12597

## THERMAL ENVIRONMENTS

- Acoustic-thermal environment for USB flap structure. Report 1: Ground simulation test results [NAL-TM-567] p 88 N90-11697

## THERMAL FATIGUE

- Designing turbine blades for fatigue and creep p 112 A90-16007

- Acoustic-thermal environment for USB flap structure. Report 1: Ground simulation test results [NAL-TM-567] p 88 N90-11697

## THERMAL SIMULATION

- Acoustic-thermal environment for USB flap structure. Report 1: Ground simulation test results [NAL-TM-567] p 88 N90-11697

## THERMAL STABILITY

- Intermetallic compounds for strong high-temperature materials - Status and potential p 125 A90-15022

## THERMAL STRESSES

- The tape method for the automatic partitioning of an arbitrary region when calculating temperature stresses p 138 A90-14587

- Effects of a heat cycle on material strength [NAL-TM-562] p 113 N90-11737

## THERMODYNAMIC PROPERTIES

- Thermodynamic calculation of the compressors of gas turbine engines and powerplants at high air pressures p 130 A90-14585

## THERMODYNAMICS

- An open-loop transient thermodynamic model of the Cougar turbojet [AD-A211774] p 114 N90-11745

## THERMOPLASTIC RESINS

- Thermoplastic composite fighter forward fuselage p 81 A90-14659

## THIN BODIES

- Dynamic analysis of lifting surfaces of small relative thickness in the case of finite displacements p 129 A90-14560

## THIN PLATES

- An investigation on combined extension and bending of thin sheets with a central crack [LR-561] p 137 N90-12958

## THIN WINGS

- Additions and corrections to SUPER: A program for calculating steady and oscillatory supersonic flow over a thin wing, tail plane and fin [AD-A211771] p 90 N90-12501  
Chordwise loading and camber for two-dimensional thin sections [AD-A213318] p 95 N90-12568

## THREAT EVALUATION

- UK airmasses involving commercial air transport, May-August 1988 [ISSN-0951-6301] p 96 N90-11717

## THREE DIMENSIONAL FLOW

- Numerical simulation of three-dimensional flow around parachute canopies p 84 A90-14438  
Wing boundary layer calculation and its application to aircraft design p 84 A90-15151  
The characteristic decay region of a class of three-dimensional wall jets p 85 A90-15241  
Experimental study of 2D/3D interactions between a vortical flow and a lifting surface p 86 A90-15849  
Three-dimensional aerodynamics of an annular airfoil cascade including loading effects p 87 A90-15889  
Simulation of glancing shock wave and boundary layer interaction [NASA-TM-102233] p 133 N90-11970

## THREE DIMENSIONAL MODELS

- Analytical studies of three-dimensional combustion processes [AD-A211903] p 126 N90-11837

## THRUST MEASUREMENT

- Measurement effects on the calculation of in-flight thrust for an F404 turbofan engine [NASA-TM-4140] p 114 N90-11741

## THRUST VECTOR CONTROL

- Minimum-time turns using vectored thrust p 118 A90-14728

## THRUST-WEIGHT RATIO

- XG40 - Rolls-Royce advanced fighter engine demonstrator p 112 A90-16002  
Creep-fatigue interactions of gas turbine materials p 131 A90-16011

## TILT ROTOR AIRCRAFT

- Designing the V-22 'Osprey' tiltrotor V/Stol aircraft for maintenance and serviceability [SAE PAPER 891075] p 101 A90-14369  
Application of the wide-field shadowgraph technique to rotor wake visualization [NASA-TM-102222] p 88 N90-11700

## TILTING ROTORS

- Application of the wide-field shadowgraph technique to rotor wake visualization [NASA-TM-102222] p 88 N90-11700

## TIME OPTIMAL CONTROL

- Sequential design of experiments with physically based models 23 [AD-A211918] p 138 N90-12239

## TITANIUM ALLOYS

- The creep behavior of the Ti3Al alloy Ti-24Al-11Nb p 125 A90-15214  
Diffusion bonding aeroengine components p 131 A90-16012  
Production of Ti6Al4V-components for a new turbo-fan-engine p 132 A90-16618  
Study on SPF and SPF/DB of the bulk-head structure with nonsymmetric shape p 132 A90-16619  
DB/SPF cooler outlet duct for aircraft application p 132 A90-16620

## TOLERANCES (MECHANICS)

- Dynamic tip clearance measurements in axial flow compressors [PNR90597] p 116 N90-12612

## TOLLIEN-SCHLICHTING WAVES

- Long-range LFC transport p 104 N90-12508  
Boundary-layer receptivity and laminar-flow airfoil design p 91 N90-12516  
Predicted and hot-film measured Tollmien-Schlichting wave characteristics p 91 N90-12523  
Design and test of an NLF wing glove for the variable-sweep transition flight experiment p 104 N90-12544

## TOMOGRAPHY

- Complementary field method for interferometric tomographic reconstruction of high speed aerodynamic flows p 131 A90-15800

## TOXIC HAZARDS

- Aircraft cabin fire suppression by means of an interior water spray system  
[CAA-PAPER-88014] p 96 N90-11719

## TRACKING (POSITION)

- The 1987 survey of track keeping and altitudes on Heathrow and Gatwick standard instrument departure routes (DAY)  
[CAA-PAPER-88010] p 99 N90-11729

## TRAILING EDGES

- The effect of trailing edge extensions on the performance of the Goettingen 797 and the Wortmann FX 63-137 aerofoil section at Reynolds numbers between  $3 \times 10$  to the 5th and  $1 \times 10$  to the 6th  
p 82 A90-13783

## TRAJECTORY OPTIMIZATION

- Minimum-time turns using vectored thrust  
p 118 A90-14728  
Penetration landing guidance trajectories in the presence of windshear p 98 A90-14732  
Acceleration, gamma, and theta guidance for abort landing in a windshear p 98 A90-14733

## TRANSITION POINTS

- Design and fabrication requirements for low noise supersonic/hypersonic wind tunnels  
p 122 N90-12555

## TRANSMISSIONS (MACHINE ELEMENTS)

- Experimental and analytical evaluation of dynamic load vibration of a 2240-kW (3000-hp) rotorcraft transmission  
p 127 A90-13750

## TRANSONIC FLOW

- Recent Navier/Stokes calculations in applications  
p 85 A90-15227  
Computation of transonic separated flow using the Euler equations  
p 85 A90-15233  
Transonic flow over a single wedge  
p 85 A90-15237  
Development of direct-inverse 3-D methods for applied transonic aerodynamic wing design and analysis  
[NASA-CR-186036] p 103 N90-11733  
Theoretical methods and design studies for NLF and HLFC swept wings at subsonic and supersonic speeds  
p 92 N90-12535  
Improvements in the formulations and numerical solution of the Euler problem for swept wings  
[RAE-TM-AERO-2139] p 95 N90-12562  
Solution of the thin-layer Navier-Stokes equations for laminar transonic flow  
[PB89-221600] p 136 N90-12879  
Multigrid solution method for the Euler equations  
[PB89-219463] p 138 N90-13116

## TRANSONIC WIND TUNNELS

- Basic aerodynamic research facility for comparative studies of flow diagnostic techniques  
p 122 N90-12526  
Residual interference assessment in adaptive wall wind tunnels  
[NASA-CR-181896] p 123 N90-12625  
The design and development of an acoustic test section for the ARA transonic wind tunnel  
[PNR90574] p 140 N90-13202  
Studies of the European transonic wind tunnel  
[ONERA-RSF-12/0694-GY] p 141 N90-13278

## TRANSPONDERS

- Mode S transponders - A new avionics product  
[SAE PAPER 891055] p 98 A90-14357

## TRANSPORT AIRCRAFT

- Structural analysis of the horizontal tail surfaces of subsonic transport aircraft  
p 102 A90-14556  
The Soviets' French revelation. II - Aircraft  
p 81 A90-14800  
Comparison of flying qualities derived from in-flight and ground-based simulators for a jet-transport airplane for the approach and landing pilot tasks  
[NASA-TP-2962] p 120 N90-11757  
The aerodynamic experimental center of Aeritalia: Combat aircraft group  
[ETN-89-95213] p 122 N90-11766  
Transport composite fuselage technology: Impact dynamics and acoustic transmission  
[NASA-CR-4035] p 126 N90-11821  
Laminar flow: Challenge and potential  
p 90 N90-12504  
Lockheed laminar-flow control systems development and applications  
p 90 N90-12506  
Long-range LFC transport  
p 104 N90-12508

## TRANSVERSE OSCILLATION

- Nonlinear transverse oscillations of a composite dynamic system  
p 129 A90-14558

## TRENDS

- The evolution of light alloys in the aerospace industry  
[ETN-89-95216] p 126 N90-11872

## TUNGSTEN OXIDES

- Electrochromic windows - Applications for aircraft  
[SAE PAPER 891063] p 129 A90-14363

## TURBINE BLADES

- Effect of the roughness of deposits in a compressor cascade on the flow lag angle  
p 84 A90-14578  
The tape method for the automatic partitioning of an arbitrary region when calculating temperature stresses  
p 138 A90-14587  
Designing turbine blades for fatigue and creep  
p 112 A90-16007  
Photoelastic investigation of turbine rotor blade shrouds  
p 112 A90-16008  
Shaft flexibility effects on aeroelastic stability of a rotating bladed disk  
p 132 A90-16371  
A computer integrated approach to dimensional inspection  
[PNR90596] p 116 N90-12611

## TURBINE ENGINES

- Simulation of a turbocompound two-stroke diesel engine  
[SAE PAPER 891066] p 110 A90-14366  
Predicting the CO, HC, and NO(x) emission and combustion efficiency of small turbine engines from the combustion chamber bench test results  
p 125 A90-15425  
A computer integrated approach to dimensional inspection  
[PNR90596] p 116 N90-12611

## TURBINE PUMPS

- Generalized relations for estimating the efficiency and basic dimensions of screw pumps and hydraulic turbines of pump units  
p 111 A90-14583

## TURBINE WHEELS

- Experimental investigations on the spatial and time-dependent structure of part-load recirculations in centrifugal pumps  
p 83 A90-13788  
Effect of the radial clearance on the efficiency of a partial microturbine  
p 111 A90-14586

## TURBOCOMPRESSORS

- Effect of the roughness of deposits in a compressor cascade on the flow lag angle  
p 84 A90-14578  
Thermodynamic calculation of the compressors of gas turbine engines and powerplants at high air pressures  
p 130 A90-14585  
Operation of a compressor with intermediate air bleed  
p 111 A90-14589  
A study on surge and rotating stall in axial compressors - A summary of the measurement and fundamental analysis method  
p 87 A90-16105  
Coatings for gas turbine compressors  
[NLR-MP-88045-U] p 115 N90-11750  
The development of a high response aerodynamic wedge probe and use on a high-speed research compressor  
[PNR90598] p 116 N90-12613  
Blading design for multi-storage HP compressor  
[PNR90602] p 116 N90-12616  
Preliminary experience with high response pressure measurements in a multistage, high speed compressor  
[RAE-TM-P-1141] p 117 N90-12619

## TURBOFAN ENGINES

- Design and development of the Garrett F109 turbofan engine  
[SAE PAPER 891046] p 109 A90-14350  
Garrett TPF351-20 turboprop fan engine development  
[SAE PAPER 891047] p 109 A90-14351  
Production of Ti6Al4V-components for a new turbo-fan-engine  
p 132 A90-16618  
STOVL propulsion system volume dynamics approximations  
[NASA-TM-102397] p 114 N90-11740  
Measurement effects on the calculation of in-flight thrust for an F404 turbofan engine  
[NASA-TM-4140] p 114 N90-11741  
Near-field noise predictions of an aircraft in cruise  
p 140 N90-12538  
The 757 NLF glove flight test results  
p 104 N90-12546  
What should be done with those noisy old aircraft  
[PNR90562] p 107 N90-12593  
Designing for reliable and low maintenance cost aero engines  
[PNR90570] p 115 N90-12604  
Blading design for multi-storage HP compressor  
[PNR90602] p 116 N90-12616  
Real-time simulation of an F110/STOVL turbofan engine  
[NASA-TM-102409] p 117 N90-12618  
The commercial aircraft noise problem  
[PNR90577] p 140 N90-13203

## TURBOJET ENGINES

- Determination of the effective areas of the mixing exhaust ducts of a bypass engine from autonomous test results  
p 102 A90-14584  
Designing turbine blades for fatigue and creep  
p 112 A90-16007

- An open-loop transient thermodynamic model of the Cougar turbojet  
[AD-A211774] p 114 N90-11745

## TURBOMACHINE BLADES

- Construction of a straight single-row airfoil lattice by the method of quasi-solutions for inverse boundary value problems  
p 84 A90-14564

## TURBOPROP AIRCRAFT

- Effect of an isolated shell on interior noise levels in a turboprop aircraft  
[SAE PAPER 891083] p 102 A90-14375

## TURBOPROP ENGINES

- Garrett TPF351-20 turboprop fan engine development  
[SAE PAPER 891047] p 109 A90-14351  
Propfan Test Assessment (PTA)  
[NASA-CR-185138] p 113 N90-11739  
UHB demonstrator interior noise control flight tests and analysis  
[NASA-CR-181897] p 140 N90-13198

## TURBOPRAMJET ENGINES

- Development study of air turbo-ramjet for future space plane  
[IAF PAPER 89-311] p 109 A90-13445

## TURBOSHAFTS

- Endurance of aircraft gas turbine mainshaft ball bearings-analysis using improved fatigue life theory. II - Application to a bearing operating under difficult lubrication conditions  
p 128 A90-13845  
Successful performance development program for the T800-LHT-800 turboshaft engine  
[SAE PAPER 891048] p 110 A90-14352

## TURBULENT BOUNDARY LAYER

- Aerodynamic heating in shock wave/turbulent boundary layer interaction regions induced by blunt fins  
p 82 A90-13775  
Wake-boundary layer interaction  
p 85 A90-15238  
Airfoil noise in a uniform flow  
p 139 A90-16330  
Experimental research on swept shock Wave/Boundary layer interactions  
[AD-A211744] p 134 N90-11988  
Reduction of turbulent drag: Boundary layer manipulators  
[CERT-RSF-OA-74/2259-AYD] p 136 N90-12889  
TURBULENT FLOW  
Variable-velocity flow at the initial mixing section in a diffuser channel  
p 84 A90-14563  
Numerical solution of unsteady Navier-Stokes equations for laminar/turbulent flows past axis-symmetric bodies at angle of attack  
p 85 A90-15235  
Numerical simulation of supersonic and hypersonic turbulent compression corner flows using PNS equations  
p 85 A90-15242  
Calculation of flowfields in side-inlet ramjet combustors with an algebraic Reynolds stress model  
p 87 A90-16367  
Some implications of the isotropic momentarily frozen assumptions for the SPAN-MAT program  
[NASA-CR-181937] p 88 N90-11704  
Transition in surface boundary layers  
[CERT-RSF-OA-43/5018-AYD] p 136 N90-12897

## TURBULENT JETS

- The characteristic decay region of a class of three-dimensional wall jets  
p 85 A90-15241  
Development process of turbulence in a round-nozzle air jet  
p 87 A90-16101

## TURBULENT WAKES

- Wake-boundary layer interaction  
p 85 A90-15238  
Development of bluff body wake in a longitudinally curved stream  
p 86 A90-15745

## TURNING FLIGHT

- Minimum-time turns using vectored thrust  
p 118 A90-14728

## TWO DIMENSIONAL BODIES

- Recent studies on the behaviour of interference fit pins in composite plates  
p 132 A90-16320

## TWO DIMENSIONAL FLOW

- Convergence properties of high-Reynolds-number separated flow calculations  
p 86 A90-15820  
Experimental study of 2D/3D interactions between a vortical flow and a lifting surface  
p 86 A90-15849  
Computation of the thin-layer Navier-Stokes equations for a 2D flow  
p 87 A90-16332  
Design of the low-speed NLF(1)-0414F and the high-speed HSNLF(1)-0213 airfoils with high-lift systems  
p 93 N90-12540  
Wind tunnel results of the low-speed NLF(1)-0414F airfoil  
p 93 N90-12541  
Wind tunnel results of the high-speed NLF(1)-0213 airfoil  
p 93 N90-12542

## TWO DIMENSIONAL JETS

- Numerical simulation of an impinging jet on a flat plate  
p 86 A90-15821

## TWO PHASE FLOW

- Effect of pressure on the electrophysical properties of two-phase flows in nozzles  
p 110 A90-14572

Heat Transfer and Fluid Mechanics Institute, 31st,  
California State University, Sacramento, June 1, 2, 1989,  
Proceedings p 130 A90-15387

## U

## UNIFORM FLOW

Airfoil noise in a uniform flow p 139 A90-16330

## UNSTEADY AERODYNAMICS

Blade surface pressure measurement on a pusher  
propeller in flight [SAE PAPER 891040] p 139 A90-14346

Variable-velocity flow at the initial mixing section in a  
diffuser channel p 84 A90-14563

Supersonic/hypersonic flow past wedge and plane ogive  
in oscillation p 85 A90-15231

A study on surge and rotating stall in axial compressors  
- A summary of the measurement and fundamental analysis  
method p 87 A90-16105

A simple active controller to suppress helicopter air  
resonance in hover and forward flight p 119 A90-16521

Prediction of unsteady blade surface pressures on an  
advanced propeller at an angle of attack [NASA-TM-102374] p 94 A90-12560

## UNSTEADY FLOW

Numerical simulation of valveless pulsed combustors  
p 127 A90-13767

Numerical solution of unsteady Navier-Stokes equations  
for laminar/turbulent flows past axisymmetric bodies at  
angle of attack p 85 A90-15235

Large-eddy simulations of pressure oscillations and  
combustion instability in a ramjet p 111 A90-15388

Unsteady aerodynamics with applications to flight  
mechanics [AD-A211944] p 89 A90-11706

Active control of unsteady and separated flow  
structures [AD-A212109] p 89 A90-11707

Steady and unsteady potential flow around thin annular  
wings and engines with simulation of jet engine flow  
[DFVLR-FB-89-18] p 89 A90-11711

Numerical simulation of unsteady rotational flow over  
propfan configurations [NASA-CR-186037] p 90 A90-12500

Unsteady three-dimensional thin-layer Navier Stokes  
solutions on dynamic blocked grids [AD-A212377] p 136 A90-12899

## UPPER SURFACE BLOWN FLAPS

Acoustic-thermal environment for USB flap structure.  
Report 1: Ground simulation test results [NAL-TM-567] p 88 A90-11697

## USER MANUALS (COMPUTER PROGRAMS)

RAN (Royal Australian Navy) vibration analysis system  
operator's guide [AD-A212441] p 107 A90-12596

## V

## V/STOL AIRCRAFT

Designing the V-22 'Osprey' tiltrotor V/Stol aircraft for  
maintenance and serviceability [SAE PAPER 891075] p 101 A90-14369

## VALUE ENGINEERING

Designing for reliable and low maintenance cost aero  
engines [PNR90570] p 115 A90-12604

## VALVES

Advanced actuation systems development, volume 1  
[AD-A213334] p 121 A90-12624

## VANADIUM ALLOYS

Production of Ti6Al4V-components for a new  
turbo-fan-engine p 132 A90-16618

## VAPORIZERS

Exhaust emission performance of a vaporizer tube  
combustor as compared with a single tube combustor  
p 111 A90-14614

## VARIABLE CYCLE ENGINES

The variable cycle diesel as an aircraft engine  
[SAE PAPER 891065] p 110 A90-14365

## VARIABLE GEOMETRY STRUCTURES

The propagation of a normal shock in a varying area  
duct p 130 A90-15045

## VARIABLE SWEEP WINGS

Design and test of an NLF wing glove for the  
variable-sweep transition flight experiment p 104 A90-12544

F-14 VSTFE and results of the clean-up flight test  
program p 105 A90-12547

Variable-Sweep Transition Flight Experiment (VSTFE):  
Stability code development and clean-up glove data  
analysis p 105 A90-12548

## VEHICLE WHEELS

Dynamic stiffness of a hydraulic damper in the system  
of a front landing gear strut p 102 A90-14555

## VELOCITY DISTRIBUTION

Supersonic boundary-layer transition on the LaRC F-106  
and the DFR F-15 aircraft. Part 2: Aerodynamic  
predictions p 94 A90-12559

## VERTICAL LANDING

STOVL propulsion system volume dynamics  
approximations [NASA-TM-102397] p 114 A90-11740

## VERTICAL TAKEOFF AIRCRAFT

Powered-lift aircraft technology [NASA-SP-501] p 107 A90-12589

## VIBRATION

RAN (Royal Australian Navy) vibration analysis system  
operator's guide [AD-A212441] p 107 A90-12596

## VIBRATION DAMPING

Dynamic damping of vibrations in mechanical systems  
by means of elastic links with distributed parameters  
p 139 A90-15568

Squeeze film damping for aircraft gas turbines  
p 113 A90-16009

Controlled design for active vibration suppression of a  
helicopter [DFVLR-FE-89-20] p 120 A90-11760

## VIBRATION ISOLATORS

Controlled design for active vibration suppression of a  
helicopter [DFVLR-FE-89-20] p 120 A90-11760

## VIBRATION MEASUREMENT

Experimental and analytical evaluation of dynamic load  
vibration of a 2240-kW (3000-hp) rotorcraft transmission  
p 127 A90-13750

Noninterference blade-vibration measurement system  
for gas turbine engines p 132 A90-16372

## VIBRATION MODE

Problems related to the acquisition, processing and  
utilization of the modal parameters measured in flight tests  
in order to obtain the full envelope for flutter [ETN-89-95210] p 103 A90-11735

## VIBRATION TESTS

Investigation of difficult component effects on finite  
element model vibration prediction for the Bell AH-1G  
helicopter. Volume 1: Ground vibration test results  
[NASA-CR-181916-VOL-1] p 134 A90-12058

## VISCOS FLOW

Computation of the thin-layer Navier-Stokes equations  
for a 2D flow p 87 A90-16332

## VISCOS FLUIDS

The method of matched integral representations in  
viscous fluid dynamics p 129 A90-14565

## VOCODERS

Assessment of voice coders for ATC/pilot voice  
communications via satellite digital communication  
channels [CAA-PAPER-89004] p 135 A90-12807

## VOLUMETRIC ANALYSIS

Volumetric analysis by spontaneous Raman diffusion in  
a supersonic wind tunnel [ISL-R-108/86] p 95 A90-12564

## VORTEX GENERATORS

Improvements in the formulations and numerical solution  
of the Euler problem for swept wings [RAE-TM-AERO-2139] p 95 A90-12562

## VORTICES

Goertler vortices in supersonic and hypersonic boundary  
layers p 83 A90-14091

Experimental study of 2D/3D interactions between a  
vortical flow and a lifting surface p 86 A90-15849

An investigation of end-wall vortex cavitation in a high  
Reynolds number axial-flow pump [AD-A211426] p 133 A90-11982

Goertler instability on an airfoil p 91 A90-12517

Experimental studies on Goertler vortices p 91 A90-12529

Development of a VSAERO (Vortex Separation  
Aerodynamics) model of the F/A-18 [AD-A212442] p 95 A90-12566

## VORTICITY

Large-eddy simulations of pressure oscillations and  
combustion instability in a ramjet p 111 A90-15388

## W

## WALL FLOW

Experimental investigations of effects of the stagger  
angle on secondary flows in plane compressor cascades  
p 83 A90-13787

## WALL JETS

The characteristic decay region of a class of  
three-dimensional wall jets p 85 A90-15241

## WARNING SYSTEMS

GPS monitor alarm limits for nonprecision approaches  
p 98 A90-15315

## WEAR RESISTANCE

Laboratory analysis of antiwear properties of  
turbine-engine fuels p 131 A90-15878

## WEDGE FLOW

Supersonic/hypersonic flow past wedge and plane ogive  
in oscillation p 85 A90-15231

Transonic flow over a single wedge p 85 A90-15237

## WIND DIRECTION

Analytical and experimental study of runway runoff with  
wind effects [PTI-8948] p 123 A90-12627

## WIND EFFECTS

Analytical and experimental study of runway runoff with  
wind effects [PTI-8948] p 123 A90-12627

## WIND PROFILES

A real-time wind model using digital data from aircraft  
[RSRE-MEMO-4309] p 137 A90-13005

## WIND SHEAR

On a pitch control law for a constant glide slope through  
windshears p 117 A90-13784

Penetration landing guidance trajectories in the  
presence of windshear p 98 A90-14732

Acceleration, gamma, and theta guidance for abort  
landing in a windshear p 98 A90-14733

Mesoscale acid deposition modeling studies  
[NASA-CR-4262] p 140 A90-13228

## WIND TUNNEL APPARATUS

Hot-film system for transition detection in cryogenic wind  
tunnels p 122 A90-12522

Basic aerodynamic research facility for comparative  
studies of flow diagnostic techniques p 122 A90-12526

Development of a multi-component internal strain-gauge  
balance for model tests in a cryogenic wind tunnel  
[NLR-TR-88157-U] p 123 A90-12628

The design and development of an acoustic test section  
for the ARA transonic wind tunnel [PNR90574] p 140 A90-13202

## WIND TUNNEL CALIBRATION

The design and development of an acoustic test section  
for the ARA transonic wind tunnel [PNR90574] p 140 A90-13202

## WIND TUNNEL MODELS

Smoothing the way to future designs - A new technique  
for wind-tunnel measurements p 121 A90-15873

Wind tunnel test of CAD USB-STOL semi-borne  
prototype [NAL-TM-566] p 88 A90-11696

## WIND TUNNEL NOZZLES

Design and fabrication requirements for low noise  
supersonic/hypersonic wind tunnels p 122 A90-12555

## WIND TUNNEL TESTS

Fatigue and electromagnetic interference test for  
Electro-Impulse De-Icing [SAE PAPER 891062] p 100 A90-14362

Wind tunnel testing of high blockage models  
p 121 A90-15743

Smoothing the way to future designs - A new technique  
for wind-tunnel measurements p 121 A90-15873

Wind tunnel test of CAD USB-STOL semi-borne  
prototype [NAL-TM-566] p 88 A90-11696

The determination of the aerodynamic characteristics  
of an ogive-cylinder body in subsonic, curved,  
incompressible flow, and an assessment of the effect of  
flow curvature [REPT-87-13] p 89 A90-11712

Low-speed wind-tunnel study of reaction control-jet  
effectiveness for hover and transition of a STOVL fighter  
concept [NASA-TM-4147] p 119 A90-11751

The aerodynamic experimental center of Aeritalia:  
Combat aircraft group [ETN-89-95213] p 122 A90-11766

Comparison of the results of tests on A300 aircraft  
in the RAE 5 metre and ONERA F1 wind tunnels  
[RAE-TM-AERO-2130] p 122 A90-11768

Research in Natural Laminar Flow and Laminar-Flow  
Control, part 2 [NASA-CP-2487-PT-2] p 91 A90-12519

Results of LFC experiment on slotted swept supercritical  
airfoil in Langley's 8-foot transonic pressure tunnel  
p 92 A90-12531

Boundary-layer stability analysis of Langley Research  
Center 8-foot LFC experimental data p 92 A90-12532

Wind tunnel results of the low-speed NLF(1)-0414F  
airfoil p 93 A90-12541

Wind tunnel results of the high-speed NLF(1)-0213  
airfoil p 93 A90-12542

## WIND TUNNEL WALLS

## SUBJECT INDEX

Design and test of a natural laminar flow/large Reynolds number airfoil with a high design cruise lift coefficient

p 93 N90-12543

Residual interference assessment in adaptive wall wind tunnels

[NASA-CR-181896] p 123 N90-12625

Development of a multi-component internal strain-gauge balance for model tests in a cryogenic wind tunnel

[NLR-TR-88157-U] p 123 N90-12628

### WIND TUNNEL WALLS

The effects of wall surface defects on boundary-layer transition in quiet and noisy supersonic flow

p 94 N90-12556

Residual interference assessment in adaptive wall wind tunnels

[NASA-CR-181896] p 123 N90-12625

### WIND TUNNELS

The production of uniformly sheared streams by means of double gauzes in wind tunnels - A mathematical analysis

p 131 A90-15887

### WIND VELOCITY

Analysis of heliport environmental data: Indianapolis downtown heliport, Wall Street heliport. Volume 2: Wall Street heliport data plots

[DOT/FAA/CT-TN87/54-VOL-2] p 121 N90-11761

Analytical and experimental study of runway runoff with wind effects

[PTI-8948] p 123 N90-12627

### WINDOWS (APERTURES)

Electrochromic windows - Applications for aircraft

[SAE PAPER 891063] p 129 A90-14363

### WING CAMBER

Chordwise loading and camber for two-dimensional thin sections

[AD-A213318] p 95 N90-12568

### WING LOADING

Advanced actuation systems development, volume 1

[AD-A213334] p 121 N90-12624

### WING PROFILES

An iterative non-linear lifting line model for wings with unsymmetrical stall

[SAE PAPER 891020] p 83 A90-14332

Structural analysis of the horizontal tail surfaces of subsonic transport aircraft

p 102 A90-14556

Wind tunnel test of CAD USB-STOL semi-borne prototype

[NAL-TM-566] p 88 N90-11696

Unsteady three-dimensional thin-layer Navier Stokes solutions on dynamic blocked grids

[AD-A212377] p 136 N90-12899

### WING SLOTS

An experimental evaluation of slots versus porous strips for laminar-flow applications

p 92 N90-12530

### WING SPAN

Spanwise distribution of lift and drag at high angles of attack

[SAE PAPER 891019] p 83 A90-14331

### WING TIPS

Flutter clearance of the F-18 high-angle-of-attack research vehicle with experimental wingtip instrumentation pods

[NASA-TM-4148] p 103 N90-11732

### WINGS

Wing boundary layer calculation and its application to aircraft design

p 84 A90-15151

Development of direct-inverse 3-D methods for applied transonic aerodynamic wing design and analysis

[NASA-CR-186036] p 103 N90-11733

A new test procedure for a wing made with carbon fiber composites

[ETN-89-95220] p 126 N90-11820

Laminar flow: The Cessna perspective

p 91 N90-12507

## X

### X-1 AIRCRAFT

'Black Betsy' - The 6000C-4 rocket engine, 1945-1989.

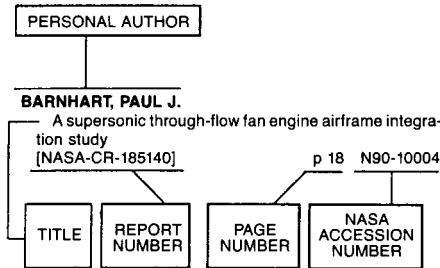

[IAF PAPER 89-726] p 141 A90-13700

### X-29 AIRCRAFT

A design procedure for the handling qualities optimization of the X-29A aircraft

[NASA-TM-4142] p 119 N90-11753

## Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

- ABALAKOV, G. V.**  
Effect of the inlet diameter and neck edge radius on the flow coefficient of straight-generator nozzles  
p 84 A90-14577
- ABRATE, SERGE**  
Composite driveshaft designs  
[SAE PAPER 891031] p 128 A90-14339
- ADELMAN, HOWARD M.**  
Integrated multidisciplinary optimization of rotorcraft: A plan for development  
[NASA-TM-101617] p 106 N90-12580  
General approach and scope p 106 N90-12581  
Rotor blade dynamic design p 106 N90-12583
- AIKAT, S.**  
Separated flow over slender wing, body and wing-body combination  
p 85 A90-15232
- AL'ES, M. IU.**  
Stress-strain analysis of structural elements of incompressible or nearly incompressible materials by the finite element method  
p 129 A90-14557
- ALA, D.**  
Development and applications of reliability and maintainability design criteria in military aircraft  
[ETN-89-95208] p 107 N90-12591
- ALEKSEEVA, T. IA.**  
Numerical modeling of the combustion kinetics of hydrocarbon fuels in an annular combustion chamber with allowance for the formation of harmful impurities  
p 124 A90-14582

Real-time decision making for autonomous flight control [SAE PAPER 891053] p 118 A90-14355

## Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

- Aeritalia S.p.A., Turin (Italy).**  
Problems related to the acquisition, processing and utilization of the modal parameters measured in flight tests in order to obtain the full envelope for flutter  
[ETN-89-95210] p 103 N90-11735  
Evolution of flight commands in Aeritalia design  
[ETN-89-95211] p 120 N90-11759  
The aerodynamic experimental center of Aeritalia: Combat aircraft group  
[ETN-89-95213] p 122 N90-11766  
Choice and characterization of new materials for aerospace applications  
[ETN-89-95219] p 126 N90-11819  
A new test procedure for a wing made with carbon fiber composites  
[ETN-89-95220] p 126 N90-11820  
The evolution of light alloys in the aerospace industry  
[ETN-89-95216] p 126 N90-11872  
In service life monitoring system using g-meter readings and mass configuration control  
[ETN-89-95218] p 134 N90-12035  
Development and applications of reliability and maintainability design criteria in military aircraft  
[ETN-89-95208] p 107 N90-12591  
Acquisition and recording an AMX A/C. Aeritalia experience and present trends  
[ETN-89-95217] p 109 N90-12598  
Project, implementation, and utilization of composite structures  
[ETN-89-95209] p 127 N90-12665  
Fatigue behavior of specimens under compression load spectra  
[ETN-89-95207] p 137 N90-12954  
**Aeronautical Research Labs., Melbourne (Australia).**  
An open-loop transient thermodynamic model of the Cougar turbojet  
[AD-A211774] p 114 N90-11745

- Additions and corrections to SUPER: A program for calculating steady and oscillatory supersonic flow over a thin wing, tail plane and fin  
[AD-A211771] p 90 N90-12501  
Development of a VSAERO (Vortex Separation Aerodynamics) model of the F/A-18  
[AD-A212442] p 95 N90-12566  
FPG2: A flight profile generator program  
[AD-A212408] p 107 N90-12595  
RAN (Royal Australian Navy) vibration analysis system operator's guide  
[AD-A212441] p 107 N90-12596  
Evaluation of a damaged F/A-18 horizontal stabilizer  
[AD-A212573] p 107 N90-12597  
**Air Force Armament Lab., Eglin AFB, FL.**  
Unsteady three-dimensional thin-layer Navier Stokes solutions on dynamic blocked grids  
[AD-A212377] p 136 N90-12899  
**Air Force Systems Command, Wright-Patterson AFB, OH.**  
Pilotless airplanes  
[AD-A211719] p 103 N90-11734  
**Akron Univ., OH.**  
Experimental and analytical evaluation of dynamic load vibration of a 2240-kW (3000-hp) rotorcraft transmission  
[AD-A212377] p 127 A90-13750  
**Analytical Services and Materials, Inc., Hampton, VA.**  
Long-range LFC transport  
p 104 N90-12508  
**Argonne National Lab., IL.**  
Analytical studies of three-dimensional combustion processes  
[AD-A211903] p 126 N90-11837  
**Arizona Univ., Tucson.**  
Boundary-layer receptivity and laminar-flow airfoil design  
p 91 N90-12516  
**Army Aviation Research and Development Command, Hampton, VA.**  
Scaling effects in the impact response of graphite-epoxy composite beams  
[SAE PAPER 891014] p 128 A90-14326  
Impact evaluation of composite floor sections  
[SAE PAPER 891018] p 100 A90-14330  
**Army Aviation Systems Command, Hampton, VA.**  
Rotor blade structural design  
p 106 N90-12584  
Validation of the procedures  
p 107 N90-12587  
**Army Belvoir Research and Development Center, Fort Belvoir, VA.**  
The prediction of middle distillate fuel properties using liquid chromatography-proton nuclear magnetic resonance spectroscopy data  
[AD-A211879] p 126 N90-11899  
**Army Cold Regions Research and Engineering Lab., Hanover, NH.**  
Ice runways near the South Pole  
[AD-A211606] p 133 N90-11908

## B

- Boeing Commercial Airplane Co., Seattle, WA.**  
Laminar flow: Challenge and potential  
p 90 N90-12504  
The 757 NLF glove flight test results  
p 104 N90-12546  
Variable-Sweep Transition Flight Experiment (VSTFE): Stability code development and clean-up glove data analysis  
p 105 N90-12548  
**Boeing Military Airplane Development, Seattle, WA.**  
Design and test of a natural laminar flow/large Reynolds number airfoil with a high design cruise lift coefficient  
p 93 N90-12543  
**Bolt, Beranek, and Newman, Inc., Cambridge, MA.**  
Some implications of the isotropic momentarily frozen assumptions for the SPAN-MAT program  
[NASA-CR-181937] p 88 N90-11704

## C

- California Univ., Los Angeles.**  
A simple active controller to suppress helicopter air resonance in hover and forward flight  
p 119 A90-16521

- Centre Aeroporte de Toulouse (France).**  
Performance and quality of a wing type parachute: Parametric analysis  
[REPT-88-19] p 89 N90-11710  
**Centre d'Etudes et de Recherches, Toulouse (France).**  
Reduction of turbulent drag: Boundary layer manipulators  
[CERT-RSF-OA-74/2259-AYD] p 136 N90-12889  
Transition in surface boundary layers  
[CERT-RSF-OA-43/5018-AYD] p 136 N90-12897  
**Cessna Aircraft Co., Wichita, KS.**  
Laminar flow: The Cessna perspective  
p 91 N90-12507  
**Civil Aviation Authority, London (England).**  
UK airmisses involving commercial air transport, May-August 1988  
[ISSN-0951-6301] p 96 N90-11717  
UK airmisses involving commercial air transport  
[CAA-2/88] p 96 N90-11718  
Aircraft cabin fire suppression by means of an interior water spray system  
[CAA-PAPER-88014] p 96 N90-11719  
The 1987 survey of track keeping and altitudes on Heathrow and Gatwick standard instrument departure routes (DAY)  
[CAA-PAPER-88010] p 99 N90-11729  
Development and evaluation at ATCEU of executive and support operations, phase 4A/3D  
[CAA-PAPER-88017] p 99 N90-12572  
Operational trial of effect of raising minimum stack level in Heathrow stacks  
[CAA-PAPER-89003] p 99 N90-12573  
Assessment of voice coders for ATC/pilot voice communications via satellite digital communication channels  
[CAA-PAPER-89004] p 135 N90-12807  
**Cranfield Inst. of Tech., Bedford (England).**  
The determination of the aerodynamic characteristics of an ogive-cylinder body in subsonic, curved, incompressible flow, and an assessment of the effect of flow curvature  
[REPT-87-13] p 89 N90-11712  
Incompressible flow about ellipsoids of revolution  
[REPT-88-02] p 90 N90-11713

## D

- Dayton Univ., OH.**  
Computation of ramjet internal flowfields  
[AD-A212001] p 114 N90-11743  
**Defence Research Establishment Atlantic, Dartmouth (Nova Scotia).**  
Chordwise loading and camber for two-dimensional thin sections  
[AD-A213318] p 95 N90-12568  
**Delta Air Lines, Inc., Atlanta, GA.**  
Penetration landing guidance trajectories in the presence of windshear  
p 98 A90-14732  
Acceleration, gamma, and theta guidance for abort landing in a windshear  
p 98 A90-14733  
**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick (Germany, F.R.).**  
Devices and procedures for the calibration of sensors and measurement: Systems of the flight test support system ATLAS  
[DFVLR-MITT-89-06] p 134 N90-12007  
**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (Germany, F.R.).**  
Steady and unsteady potential flow around thin annular wings and engines with simulation of jet engine flow  
[DFVLR-FB-89-18] p 89 N90-11711  
**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen (Germany, F.R.).**  
Controller design for active vibration suppression of a helicopter  
[DFVLR-FB-89-20] p 120 N90-11760  
**Deutsche Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick (Germany, F.R.).**  
Automatic processing of images from the GRATE flight test tool  
[DLR-FB-89-28] p 109 N90-12599

- Douglas Aircraft Co., Inc., Long Beach, CA.**  
 LFC: A maturing concept  
 [DOUGLAS-PAPER-7878] p 90 N90-12505  
 The right wing of the LEFT airplane p 91 N90-12510  
 UHB demonstrator interior noise control flight tests and analysis  
 [NASA-CR-181897] p 140 N90-13198  
**Dynamic Controls, Inc., Dayton, OH.**  
 Advanced actuation systems development, volume 1  
 [AD-A213334] p 121 N90-12624  
**Dynetics, Inc., Huntsville, AL.**  
 Adaptive control law design for model uncertainty compensation  
 [AD-A211712] p 120 N90-11758

**E**

- ESDU International Ltd., London (England).**  
 Normal-force-curve and pitching-moment-curve slopes of forebody-cylinder combinations at zero angle of attack for Mach numbers up to 5  
 [ESDU-89008] p 89 N90-11709  
**European Space Agency, Paris (France).**  
 A robust digital model following controller for helicopters  
 [ESA-TT-1041] p 120 N90-12621

**F**

- Federal Aviation Administration, Atlantic City, NJ.**  
 Analysis of heliport environmental data: Indianapolis downtown heliport, Wall Street heliport. Volume 2: Wall Street heliport data plots  
 [DOT/FAA/CT-TN87/54-VOL-2] p 121 N90-11761  
 ILS mathematical modeling study of the effects of proposed hangar construction at the Orlando International Airport, Runway 17R, Orlando, Florida  
 [DOT/FAA/CT-TN89/52] p 121 N90-11762  
 Parallel approach separation and controller performance: A study of the impact of two separation standards  
 [DOT/FAA/CT-TN89/50] p 99 N90-12574  
 Aircraft Reply and Interference Environment Simulator (ARIES) hardware principles of operation. Volume 2: Appendixes  
 [DOT/FAA/CT-TN88/4-2] p 135 N90-12781  
 Aircraft Reply and Interference Environment Simulator (ARIES) hardware principles of operation, volume 1  
 [DOT/FAA/CT-TN88/4-1] p 135 N90-12782  
**Federal Aviation Administration, Washington, DC.**  
 FAA air traffic activity: Fiscal year 1988  
 [AD-A211338] p 99 N90-12570

**G**

## Typical Foreign Technology Index Listing

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

### AUSTRALIA

- An open-loop transient thermodynamic model of the Cougar turbojet [AD-A211774] p 114 A90-11745
- Additions and corrections to SUPER: A program for calculating steady and oscillatory supersonic flow over a thin wing, tail plane and fin [AD-A211771] p 90 A90-12501
- Development of a VSAERO (Vortex Separation Aerodynamics) model of the F/A-18 [AD-A212442] p 95 A90-12566
- FGP2: A flight profile generator program [AD-A212408] p 107 A90-12595
- RAN (Royal Australian Navy) vibration analysis system operator's guide [AD-A212441] p 107 A90-12596
- Evaluation of a damaged F/A-18 horizontal stabilizer [AD-A212573] p 107 A90-12597

## C

### CANADA

- A test of airborne kinematic GPS positioning for aerial photography - Methodology p 97 A90-13982
- A test of kinematic GPS combined with aerial photography - Organization, logistics and results p 97 A90-13983
- Designing the next generation flying test bed [SAE PAPER 891049] p 100 A90-14353
- Chordwise loading and camber for two-dimensional thin sections [AD-A213318] p 95 A90-12568

### CHINA, PEOPLE'S REPUBLIC OF

- Preliminary analysis of methodology for assessment of propulsion system for aerospace plane [IAF PAPER 89-307] p 123 A90-13442

- Exhaust emission performance of a vaporizer tube combustor as compared with a single tube combustor p 111 A90-14614
- Aeroelastic characteristics of wings in subsonic flow p 102 A90-14615
- Wing boundary layer calculation and its application to aircraft design p 84 A90-15151
- Study on SP<sup>2</sup> and SP<sup>2</sup>/DB of the bulk-head structure with nonsymmetric shape p 132 A90-16619
- Pilotless airplanes [AD-A211719] p 103 A90-11734

## F

### FINLAND

- Solution of the thin-layer Navier-Stokes equations for laminar transonic flow [PB89-221600] p 136 A90-12879
- Multigrid solution method for the Euler equations [PB89-219463] p 138 A90-13116

### FRANCE

- Experimental study of 2D/3D interactions between a vortical flow and a lifting surface p 86 A90-15849
- Designing turbine blades for fatigue and creep p 112 A90-16007
- Airfoil noise in a uniform flow p 139 A90-16330
- Computation of the thin-layer Navier-Stokes equations for a 2D flow p 87 A90-16332
- Performance and quality of a wing type parachute: Parametric analysis [REPT-88-19] p 89 A90-11710
- Numerical simulation of aeroplane response to a lightning injection [ETN-89-95271] p 96 A90-11716
- Volumetric analysis by spontaneous Raman diffusion in a supersonic wind tunnel [ISL-R-109/88] p 95 A90-12564
- Euler equation solutions applied to a helicopter rotor in forward moving flight [ONERA-RSF-32/1285-AY-346A] p 107 A90-12592
- Integration of a centralized multiplexed control unit into the cockpit of an aircraft [F6150-DT41C-1-88329] p 120 A90-12622
- Reduction of turbulent drag: Boundary layer manipulators [CERT-RSF-OA-74/2259-AYD] p 136 A90-12889
- Transition in surface boundary layers [CERT-RSF-OA-43/5018-AYD] p 136 A90-12897
- Studies of the European transonic wind tunnel [ONERA-RSF-12/0694-GY] p 141 A90-13278

## G

### GERMANY, FEDERAL REPUBLIC OF

- Experimental investigations of effects of the stagger angle on secondary flows in plane compressor cascades p 83 A90-13787
- Experimental investigations on the spatial and time-dependent structure of part-load recirculations in centrifugal pumps p 83 A90-13788
- Smoothing the way to future designs - A new technique for wind-tunnel measurements p 121 A90-15873
- Production of Ti6Al4V-components for a new turbo-fan-engine p 132 A90-16618
- DB/SPF cooler outlet duct for aircraft application p 132 A90-16620
- Steady and unsteady potential flow around thin annular wings and engines with simulation of jet engine flow [DFVLR-FB-83-18] p 89 A90-11711
- Controller design for active vibration suppression of a helicopter [DFVLR-FB-83-20] p 120 A90-11760
- Devices and procedures for the calibration of sensors and measurement: Systems of the flight test support system ATTAS [DFVLR-MIT-89-06] p 134 A90-12007
- General data processing support from project planning to workshop control [MBB-UD-526/88-PUB] p 138 A90-12208

[FEL-1989-44] p 135 N90-12823
- An investigation on combined extension and bending of thin sheets with a central crack  
[LR-561] p 137 N90-12958

## NIGERIA

- Numerical simulation of valveless pulsed combustors  
p 127 A90-13767

## P

## POLAND

- Balance model of the perfectly stirred reactor with the discontinuity surface  
p 125 A90-14652
- Criteria for evaluating the flight dynamics model of flight simulators  
p 121 A90-15422

- An analysis of the possibility of using direct control of the lifting force for modifying the flying qualities of aircraft  
p 118 A90-15423
- Evaluation of the dynamic properties of the auto-pilot servo of a single-rotor helicopter through laboratory testing  
p 118 A90-15424
- Predicting the CO, HC, and NO(x) emission and combustion efficiency of small turbine engines from the combustion chamber bench test results  
p 125 A90-15425
- The FAA technical classification of aircraft and airports  
p 96 A90-15876
- NMG - A system of numerical representation of aircraft geometry  
p 103 A90-15877
- Laboratory analysis of antiwear properties of turbine-engine fuels  
p 131 A90-15878

## PORTUGAL

- On a pitch control law for a constant glide slope through windshears  
p 117 A90-13784

## S

## SWEDEN

- Interior noise control of the Saab 340 aircraft  
[SAE PAPER 891080] p 101 A90-14372
- Finite element calculations of the interior noise of the Saab 340 aircraft  
[SAE PAPER 891081] p 101 A90-14373

## T

## TAIWAN

- Numerical simulation of an impinging jet on a flat plate  
p 86 A90-15821
- Calculation of flowfields in side-inlet ramjet combustors with an algebraic Reynolds stress model  
p 87 A90-16367

## U

## U.S.S.R.

- Numerical simulation of three-dimensional flow around parachute canopies  
p 84 A90-14438
- Dynamic stiffness of a hydraulic damper in the system of a front landing gear strut  
p 102 A90-14555
- Structural analysis of the horizontal tail surfaces of subsonic transport aircraft  
p 102 A90-14556
- Stress-strain analysis of structural elements of incompressible or nearly incompressible materials by the finite element method  
p 129 A90-14557
- Nonlinear transverse oscillations of a composite dynamic system  
p 129 A90-14558
- Dynamic analysis of lifting surfaces of small relative thickness in the case of finite displacements  
p 129 A90-14560
- Synthesis of locally optimal aircraft control in the presence of delay  
p 137 A90-14561
- Variable-velocity flow at the initial mixing section in a diffuser channel  
p 84 A90-14563
- Construction of a straight single-row airfoil lattice by the method of quasi-solutions for inverse boundary value problems  
p 84 A90-14564
- The method of matched integral representations in viscous fluid dynamics  
p 129 A90-14565
- A numerical method for calculating supersonic nonisobaric jets  
p 84 A90-14566
- Validation of the accelerated equivalent testing of gas turbine engines for multivariant applications  
p 110 A90-14568
- A minimal permissible radial clearance in a gas turbine  
p 110 A90-14569
- Estimation of the technical risk criterion in selecting the operating parameters of aircraft gas turbine engines  
p 110 A90-14570
- The principle of jet engine thrust generation  
p 110 A90-14571
- Effect of pressure on the electrophysical properties of two-phase flows in nozzles  
p 110 A90-14572
- Design of a language for the testing of aircraft engines  
p 137 A90-14573
- A study of the nonlinear deformation of a shell of revolution with a surface bend  
p 129 A90-14574
- Parametric synthesis of piecewise constant locally optimal aircraft control under conditions of indeterminacy  
p 137 A90-14576
- Effect of the inlet diameter and neck edge radius on the flow coefficient of straight-generatrix nozzles  
p 84 A90-14577
- Effect of the roughness of deposits in a compressor cascade on the flow lag angle  
p 84 A90-14578
- Calculation of cone drag  
p 84 A90-14579
- Increasing the heat conductivity of elastic damping elements of MR material  
p 102 A90-14580

- Numerical modeling of the combustion kinetics of hydrocarbon fuels in an annular combustion chamber with allowance for the formation of harmful impurities  
p 124 A90-14582
- Generalized relations for estimating the efficiency and basic dimensions of screw pumps and hydraulic turbines of pump units  
p 111 A90-14583
- Determination of the effective areas of the mixing exhaust ducts of a bypass engine from autonomous test results  
p 102 A90-14584
- Thermodynamic calculation of the compressors of gas turbine engines and powerplants at high air pressures  
p 130 A90-14585
- Effect of the radial clearance on the efficiency of a partial microturbine  
p 111 A90-14586
- The tape method for the automatic partitioning of an arbitrary region when calculating temperature stresses  
p 138 A90-14587
- Calculation of vibrational combustion limits in Helmholtz resonator-type chambers  
p 125 A90-14588
- Operation of a compressor with intermediate air bleed  
p 111 A90-14589
- Effect of the angle of attack on the efficiency and thrust ratio of axial-flow microturbines with full admission  
p 111 A90-14590
- Classification of methods for eliminating surging in gas turbine engines  
p 111 A90-14591
- Dynamic damping of vibrations in mechanical systems by means of elastic links with distributed parameters  
p 139 A90-15568
- Calculation of flow past delta wings in the thin shock layer approximation  
p 86 A90-15624
- Dynamics of aviation gas turbine engines  
p 113 A90-16049

## UNITED KINGDOM

- The effect of trailing edge extensions on the performance of the Goettingen 797 and the Wortmann FX 63-137 airfoil section at Reynolds numbers between  $3 \times 10$  to the 5th and  $1 \times 10$  to the 6th  
p 82 A90-13783
- The effect of flow curvature on the aerodynamic characteristics of an ogive-cylinder body  
p 82 A90-13785
- General Dynamics F-16  
p 100 A90-13791
- Holographic head-up displays for air and ground applications  
p 108 A90-13885
- The role of adaptive antenna systems when used with GPS  
p 128 A90-13995
- Signal processing in a digital GPS receiver  
p 128 A90-14006
- Carbon fibre composite bolted joints  
p 130 A90-15354
- Experimental study on the buckling and postbuckling of carbon fibre composite panels with and without interply disbonds  
p 130 A90-15355
- The advantages of automation in aerospace production  
p 130 A90-15357
- An investigation into the internal heat transfer characteristics of a thermally anti-iced aero-engine intake lipskin  
p 111 A90-15390
- Advantage Airbus?  
p 102 A90-15746
- The production of uniformly sheared streams by means of double gauzes in wind tunnels - A mathematical analysis  
p 131 A90-15887
- YG40 - Rolls-Royce advanced fighter engine demonstrator  
p 112 A90-16002
- Diffusion bonding aeroengine components  
p 131 A90-16012
- The manufacture of SPF military aircraft doors in aluminium alloy  
p 132 A90-16616
- Normal-force-curve and pitching-moment-curve slopes of forebody-cylinder combinations at zero angle of attack for Mach numbers up to 5  
[ESDU-89008] p 89 N90-11709
- The determination of the aerodynamic characteristics of an ogive-cylinder body in subsonic, curved, incompressible flow, and an assessment of the effect of flow curvature  
[REPT-87-13] p 89 N90-11712
- Incompressible flow about ellipsoids of revolution  
[REPT-88-02] p 90 N90-11713
- UK airmisses involving commercial air transport, May-August 1988  
[ISSN-0951-6301] p 96 N90-11717
- UK airmisses involving commercial air transport  
[CAA-2/88] p 96 N90-11718
- Aircraft cabin fire suppression by means of an interior water spray system  
[CAA-PAPER-88014] p 96 N90-11719
- A simulation study of landing time allocation procedures for use in computer-assisted air traffic management systems  
[AD-A212159] p 99 N90-11722

The 1987 survey of track keeping and altitudes on Heathrow and Gatwick standard instrument departure routes (DAY)

[CAA-PAPER-88010] p 99 N90-11729

The RB199: An in-service success

[PNR90544] p 114 N90-11746

Advanced technology in military gas turbine design and manufacture

[PNR90545] p 114 N90-11747

Engine controls for the 1990's

[PNR90546] p 114 N90-11748

Future military powerplants

[PNR90554] p 114 N90-11749

Comparison of the results of tests on A300 aircraft in the RAE 5 metre and ONERA F1 wind tunnels

[RAE-TM-AERO-2130] p 122 N90-11768

Aluminium alloy development for aero engines

[PNR90548] p 126 N90-11874

Improvements in the formulations and numerical solution of the Euler problem for swept wings

[RAE-TM-AERO-2139] p 95 N90-12562

CFD methods for drag prediction and analysis currently in use in UK

[RAE-TM-AERO-2146] p 95 N90-12563

Development and evaluation at ATCEU of executive and support operations, phase 4A/3D

[CAA-PAPER-88017] p 99 N90-12572

Operational trial of effect of raising minimum stack level in Heathrow stacks

[CAA-PAPER-89003] p 99 N90-12573

Software fault tolerance

[RSRE-MEMO-4237] p 99 N90-12575

What should be done with those noisy old aircraft

[PNR90562] p 107 N90-12593

A vision of the future: The new engine technology

[PNR90566] p 115 N90-12603

Designing for reliable and low maintenance cost aero engines

[PNR90570] p 115 N90-12604

The next generation supersonic transport engine: Critical issues

[PNR90576] p 115 N90-12605

Re-engine with the Rolls-Royce Tay 670, the route to significant noise reduction

[PNR90585] p 115 N90-12606

The role of component testing

[PNR90589] p 115 N90-12608

Flanged joints of aeroengines

[PNR90594] p 116 N90-12609

Material requirements for future aeroengines

[PNR90595] p 116 N90-12610

A computer integrated approach to dimensional inspection

[PNR90596] p 116 N90-12611

Dynamic tip clearance measurements in axial flow compressors

[PNR90597] p 116 N90-12612

The development of a high response aerodynamic wedge probe and use on a high-speed research compressor

[PNR90598] p 116 N90-12613

Gas turbine performance analysis

[PNR90599] p 116 N90-12614

Blading design for multi-storage HP compressor

[PNR90602] p 116 N90-12616

Preliminary experience with high response pressure measurements in a multistage, high speed compressor

[RAE-TM-P-1141] p 117 N90-12619

Composite materials for future aeroengines

[PNR90584] p 127 N90-12667

The future of non ferrous metals in aerospace engines

[PNR90572] p 127 N90-12720

Assessment of voice coders for ATC/pilot voice communications via satellite digital communication channels

[CAA-PAPER-89004] p 135 N90-12807

Fine resolution errors in secondary surveillance radar altitude reporting amongst aircraft transmitting the conspicuity codes 4321 and 4322

[RSRE-88004] p 135 N90-12816

The nature and control of skidding in lightly loaded intershaft bearings

[PNR90591] p 136 N90-12933

A real-time wind model using digital data from aircraft

[RSRE-MEMO-4309] p 137 N90-13005

The design and development of an acoustic test section for the ARA transonic wind tunnel

[PNR90574] p 140 N90-13202

The commercial aircraft noise problem

[PNR90577] p 140 N90-13203

Acoustic recording systems for use in military aircraft

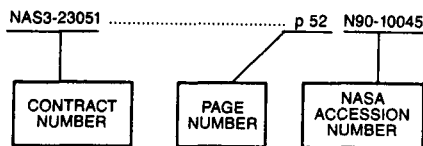

[RAE-TM-MM-11] p 140 N90-13207

# CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 250)

March 1990

## Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under the contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

## Typical Report Number Index Listing

Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (\*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# ACCESSION NUMBER INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 250)

March 1990

## Typical Accession Number Index Listing

Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (\*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A90-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at \$10.00 per document (up to 50 pages), additional pages \$0.25 each. Microfiche<sup>(1)</sup> of documents announced in *IAA* are available at the rate of \$4.00 per microfiche on demand. Standing order microfiche are available at the rate of \$1.45 per microfiche for *IAA* source documents and \$1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is \$2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N90-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, VA 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the \* symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report number* shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

- Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.
- Avail: ESDU. Pricing information on specific data, computer programs, and details on Engineering Sciences Data Unit (ESDU) topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on the page titled ADDRESSES OF ORGANIZATIONS.
- Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, CA. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, DC 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.
- Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.
- Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of \$1.50 each, postage free.
- Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.
- Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

## **PUBLIC COLLECTIONS OF NASA DOCUMENTS**

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, NY 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and \* from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

## **FEDERAL DEPOSITORY LIBRARY PROGRAM**

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 51 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 51 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## **STANDING ORDER SUBSCRIPTIONS**

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB90-914100 at the price of \$11.50 domestic and \$23.00 foreign. The price of the annual index is \$17.75. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.
